Top quark pair production and decay with jet activity at the LHC

Giuseppe Bevilacqua
NCSR "Demokritos"

Theory Seminar

Vienna
November 7, 2023

Work in collaboration with H.Y.Bi, B.Hartanto, M.Kraus, M. Lupattelli, D. Stremmer and M.Worek

Based on: JHEP 08 (2021) 008 Phys.Rev.D 107 (2023) 11, 014028 Phys.Rev.D 107 (2023) 11, 114027

Fundamentals of top quark physics

Why is top quark physics interesting?

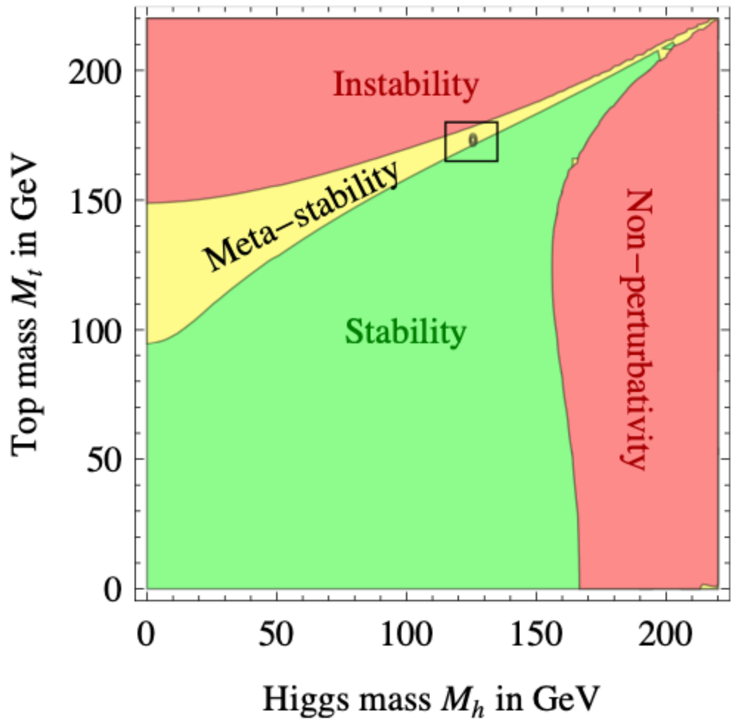
$$y_t = \sqrt{2}\,\frac{m_t}{v} \approx 1$$

- The top quark is the heaviest particle of the Standard Model

  ↪ • Substantial Yukawa coupling: sensitive to EWSB mechanism

  • Top mass is a free parameter: need precise measurements

[Degrassi et al., JHEP 08 (2012) 098]



- Extremely short-lived $\sim 5 \cdot 10^{-25}\,\text{s} \ll \Lambda_{QCD}^{-1}$

  ↪ • Decays before bound states can be formed

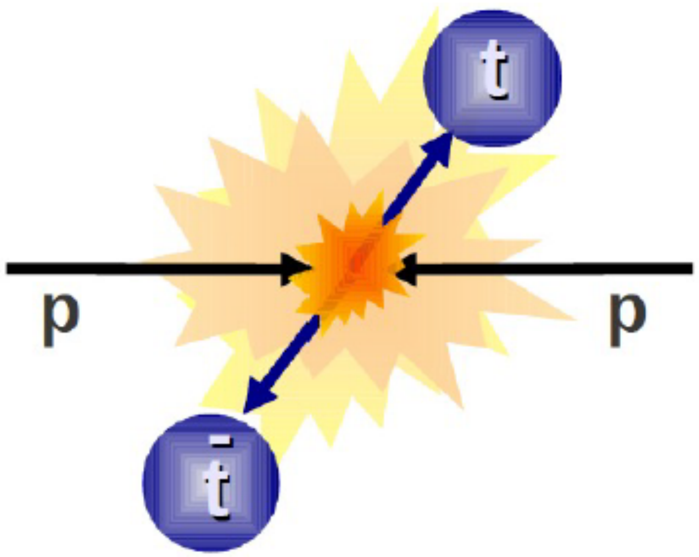
  • $\text{BR}(t \to Wb) \approx 100\,\%$: unique experimental signature

  • Direct handle of top quark properties from decay products

Production	**Decays**	**Intrinsic properties**
• Inclusive rates • Differential distributions • New production mechanisms • …	• Decay channels (SM & BSM) • Couplings to SM particles • Spin correlations • …	• Mass • Charge • Lifetime • Width • …

$t\bar{t}$ production at the LHC

- Dominant mode of top quark production at the LHC
- Can be selected with high purity (dilepton, but also ℓ+jets)
- $\mathcal{O}(100\,\text{M})$ $t\bar{t}$ events in Run 2
- "Standard candle" for precisions tests of SM



[LHCPhysics/TtbarNNLO]

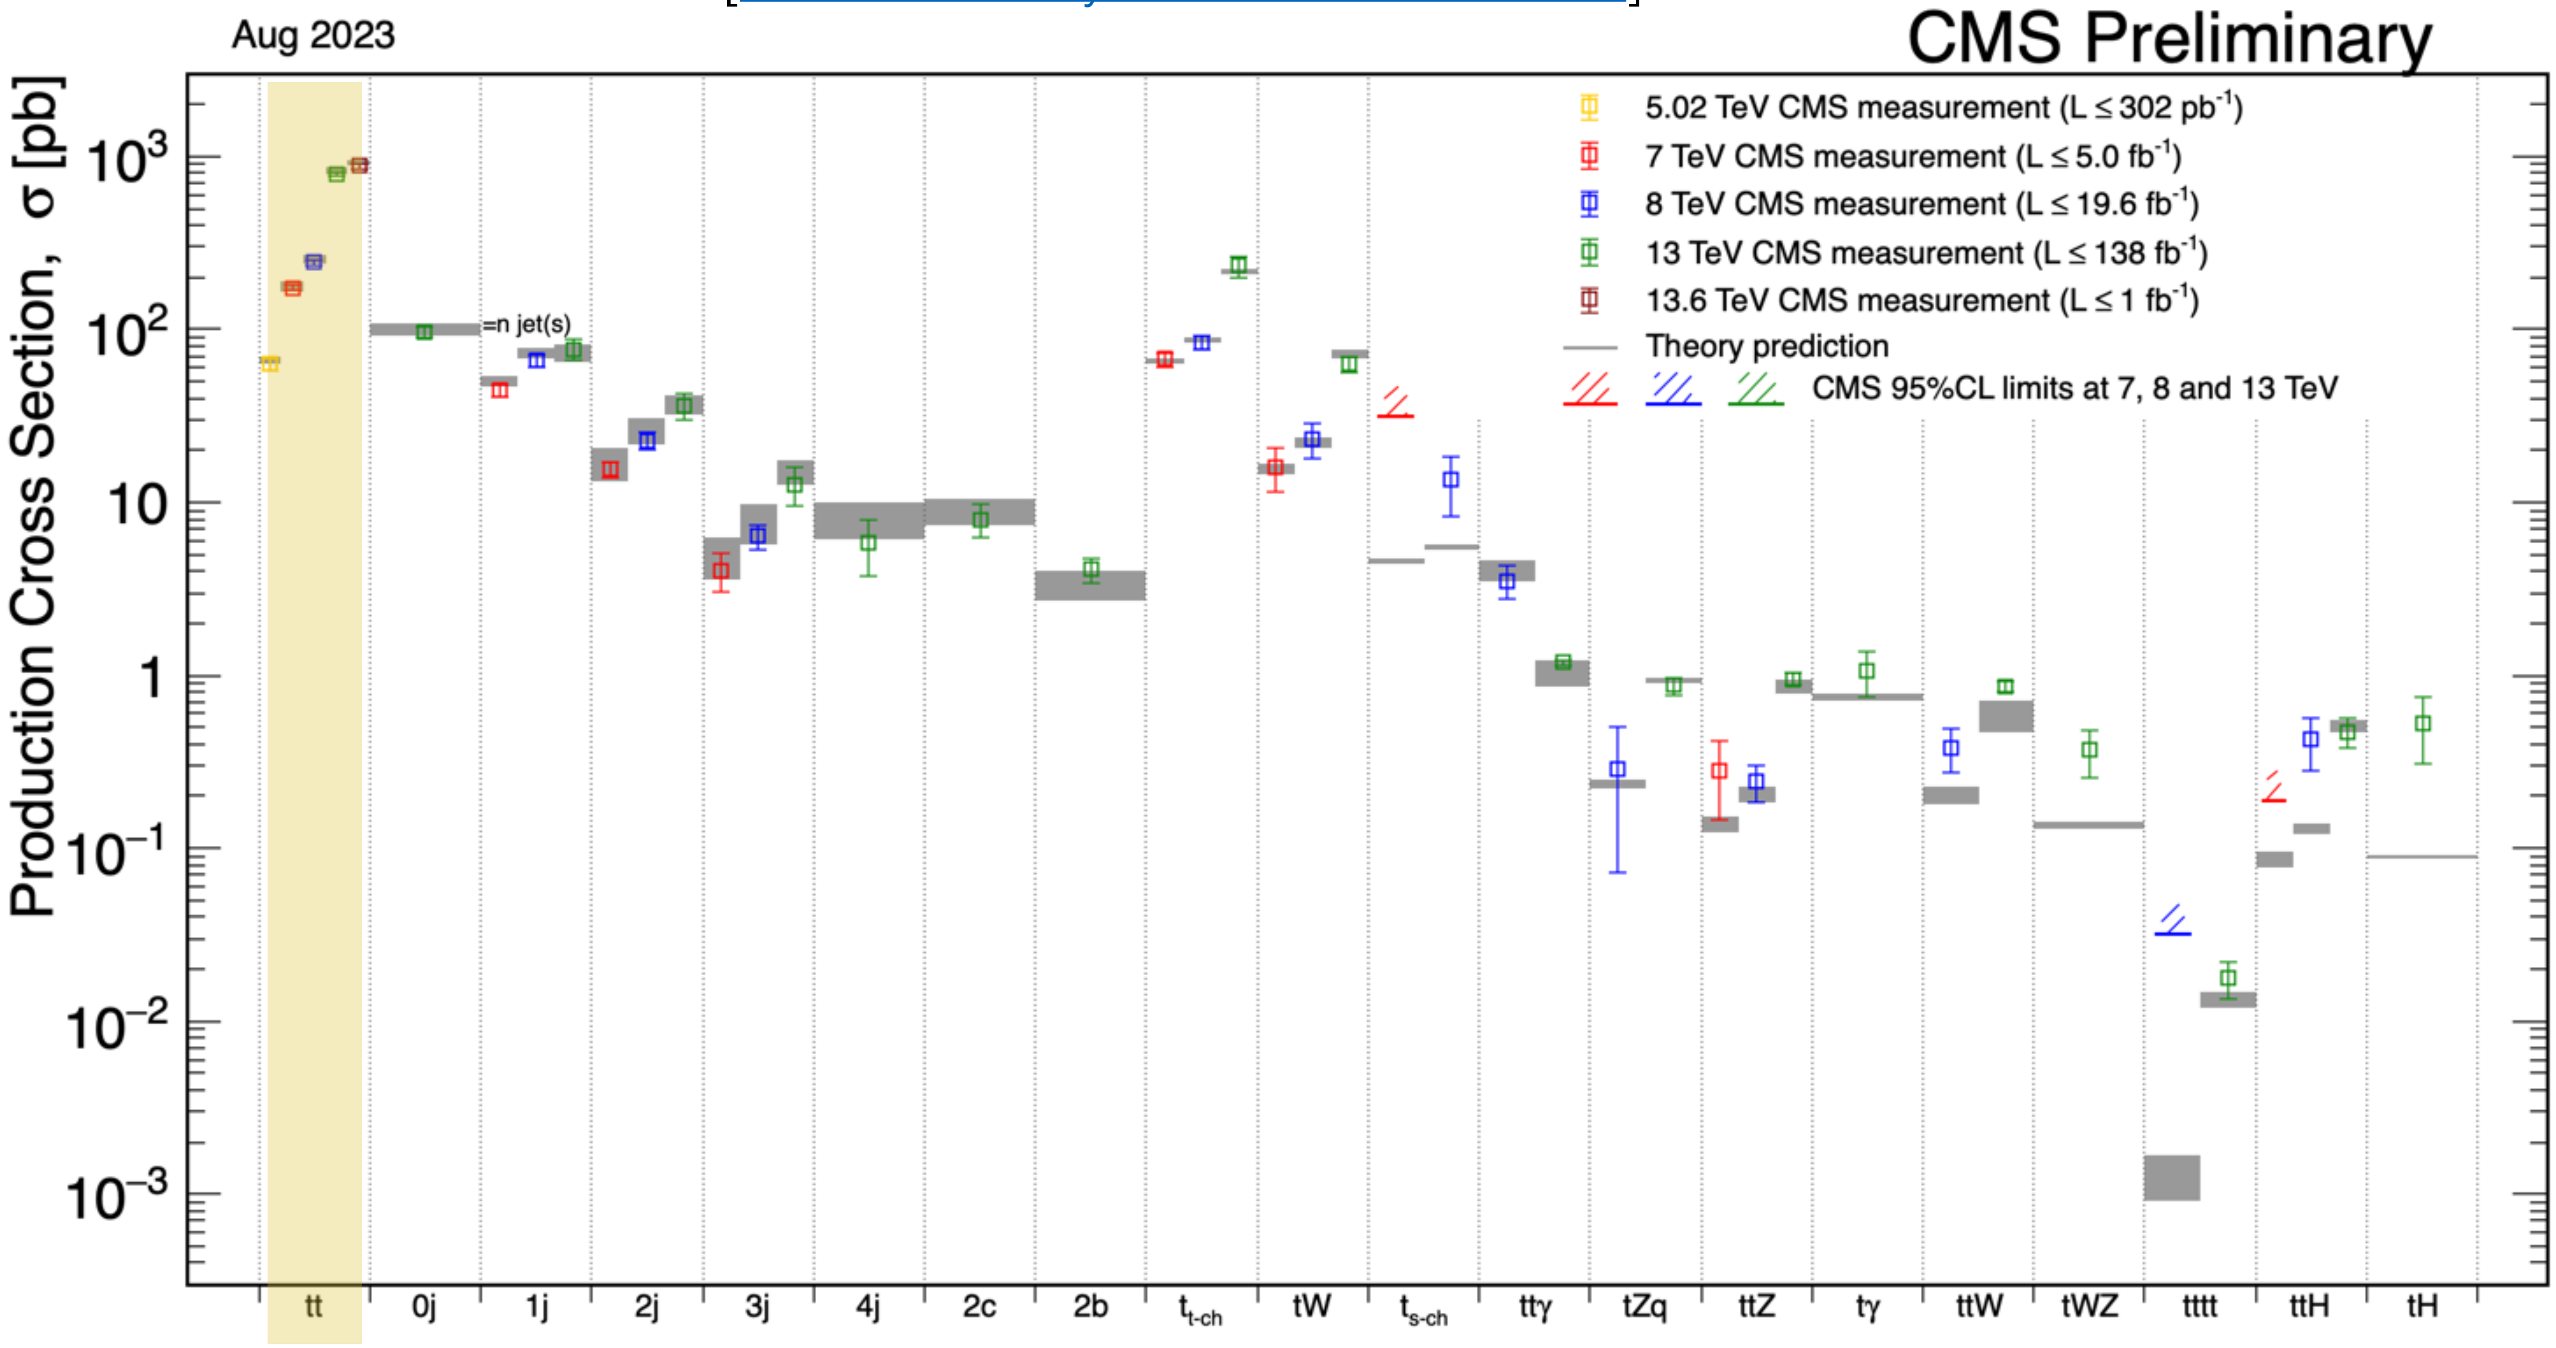
Top quark production cross sections

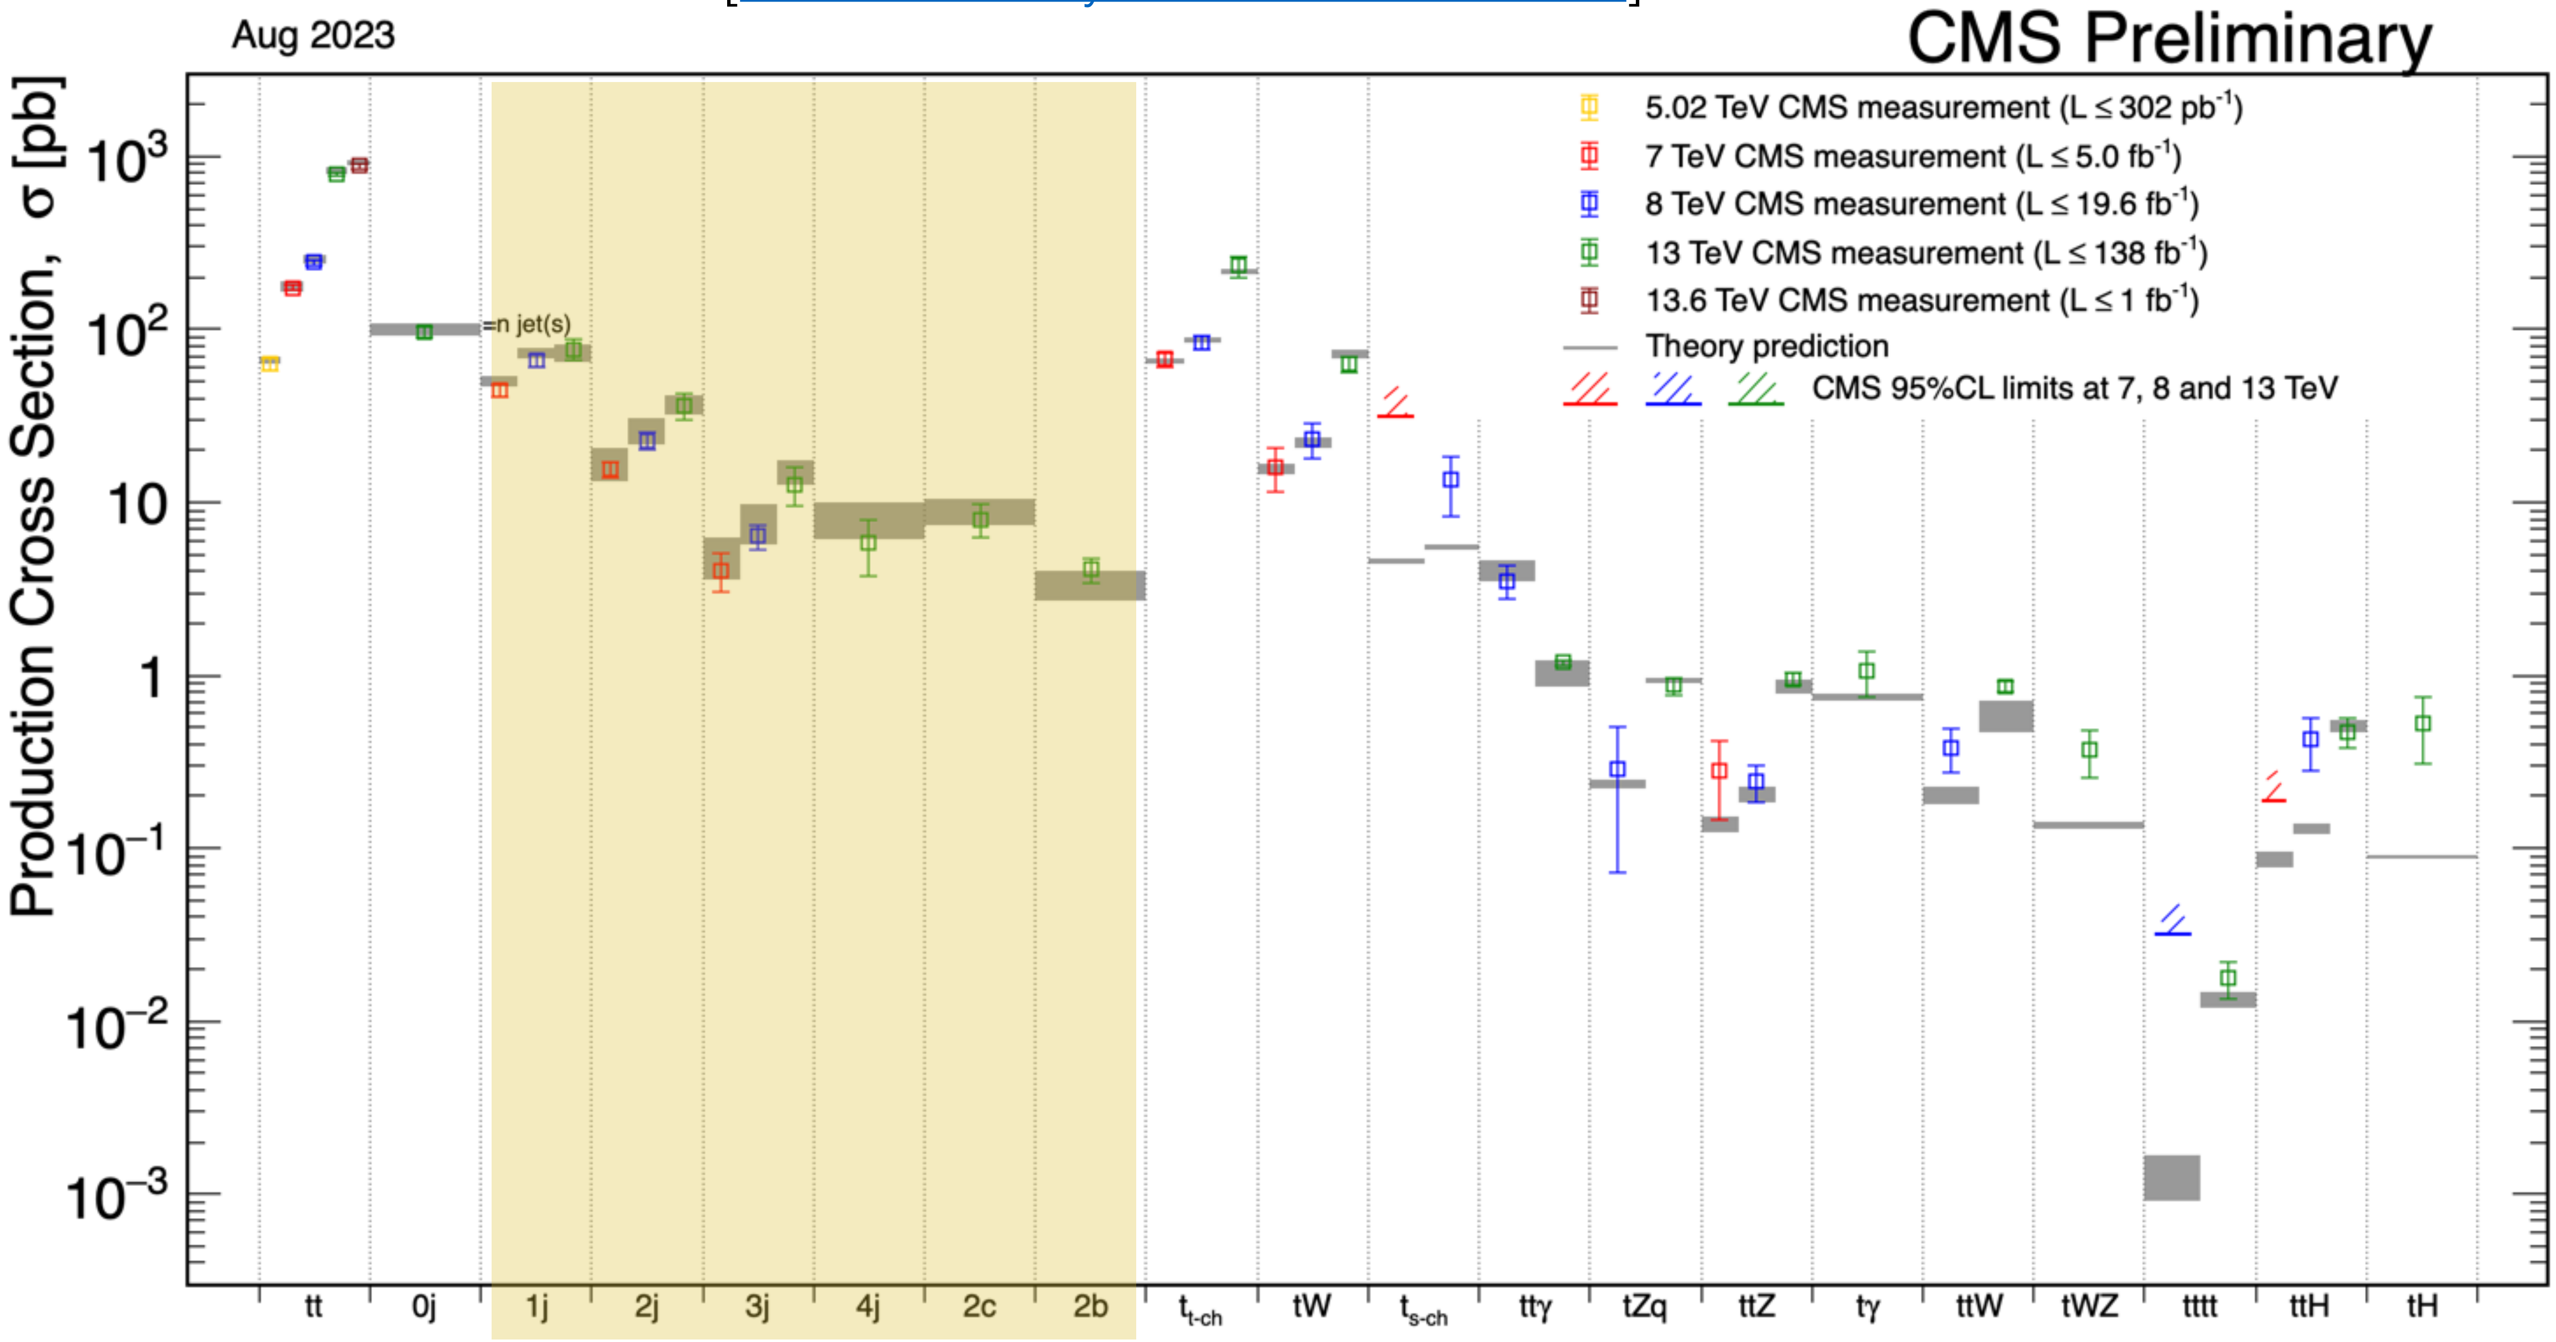
[CMSPublic/PhysicsResultsCombined]



Inclusive $t\bar{t}$ sample

Top quark production cross sections

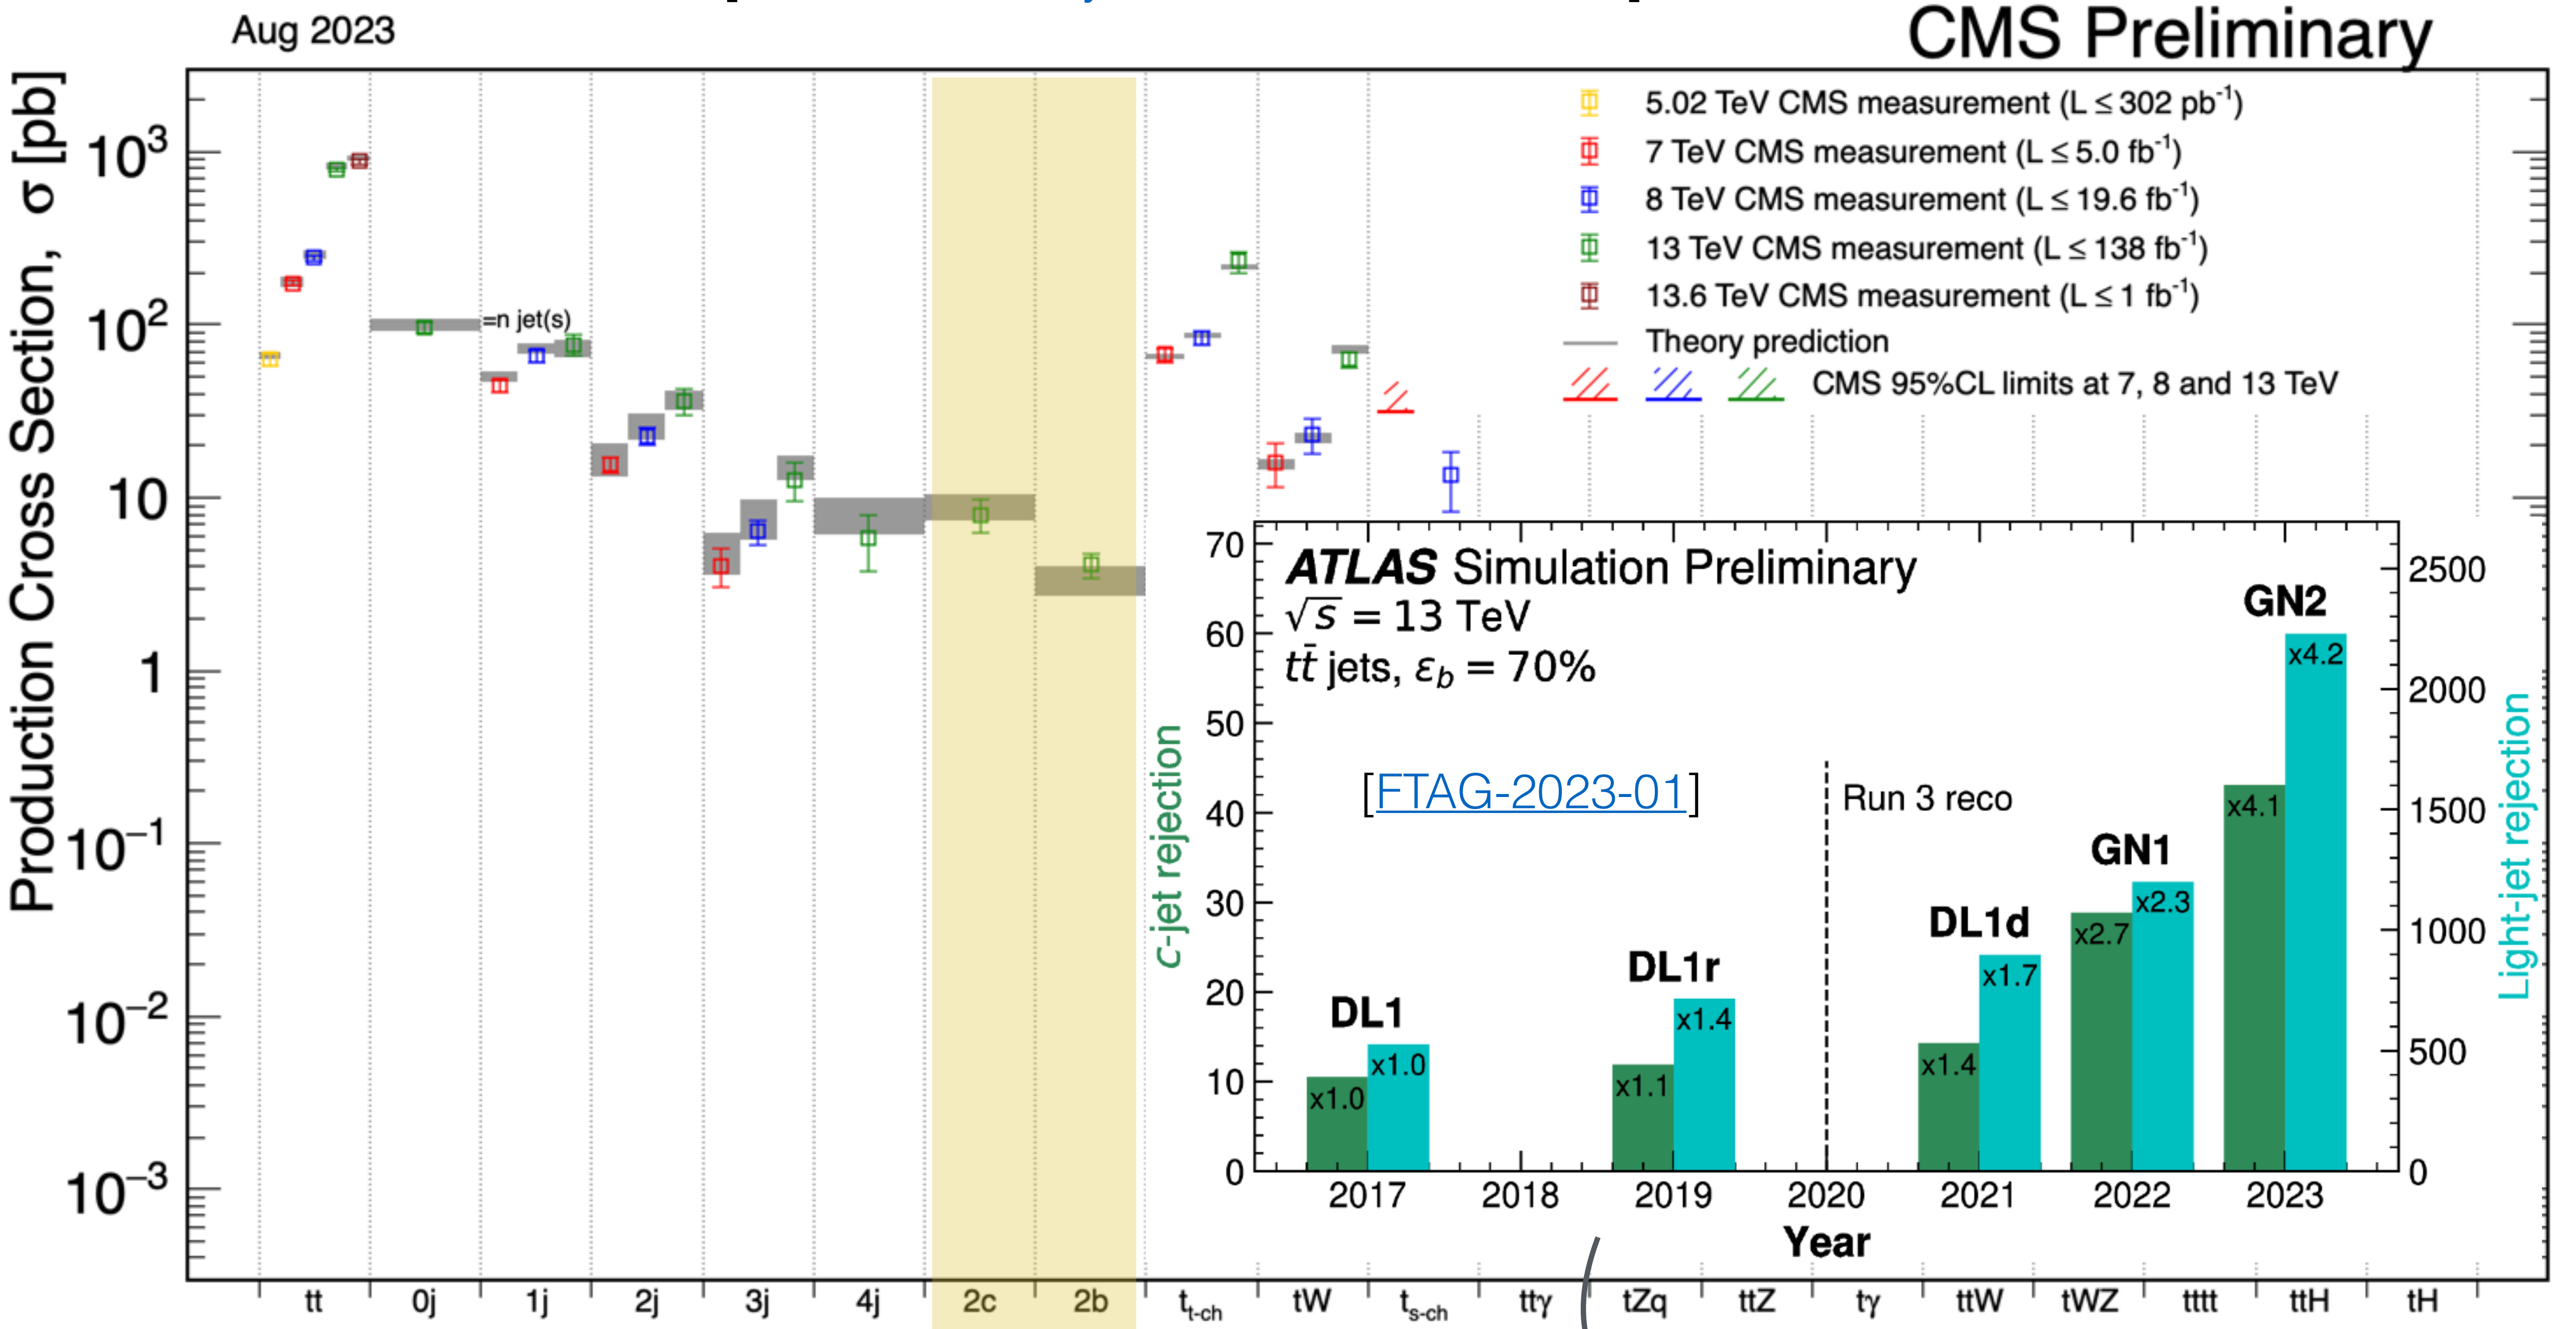
[CMSPublic/PhysicsResultsCombined]



Hadronic jet activity in $t\bar{t}$ events

Top quark production cross sections

[CMSPublic/PhysicsResultsCombined]

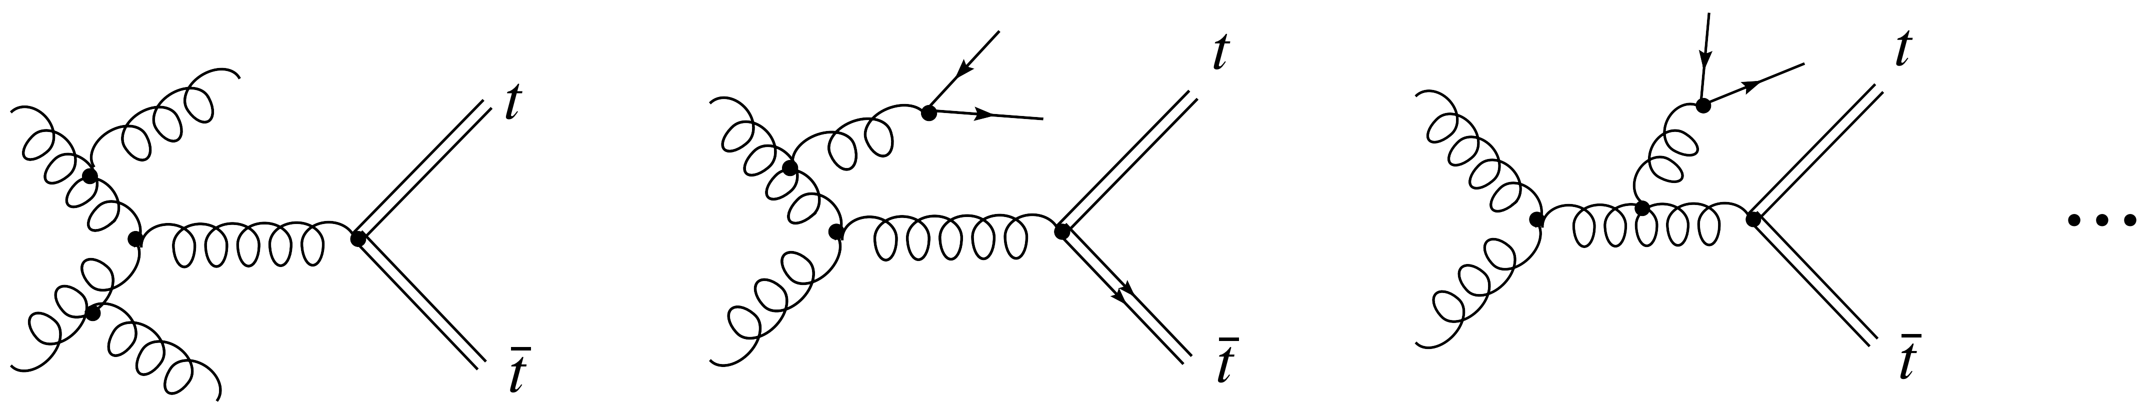


$t\bar{t}$ + HF

b- and *c*-tagging algorithms are constantly improving

$t\bar{t}$+jets as a signal

- A significant fraction of the inclusive $t\bar{t}$ sample is accompanied by additional hard jet(s) arising from QCD radiation



- Genuine *multiscale* process with characteristic scales typically separated by one order of magnitude $\rightarrow$ test of perturbative QCD

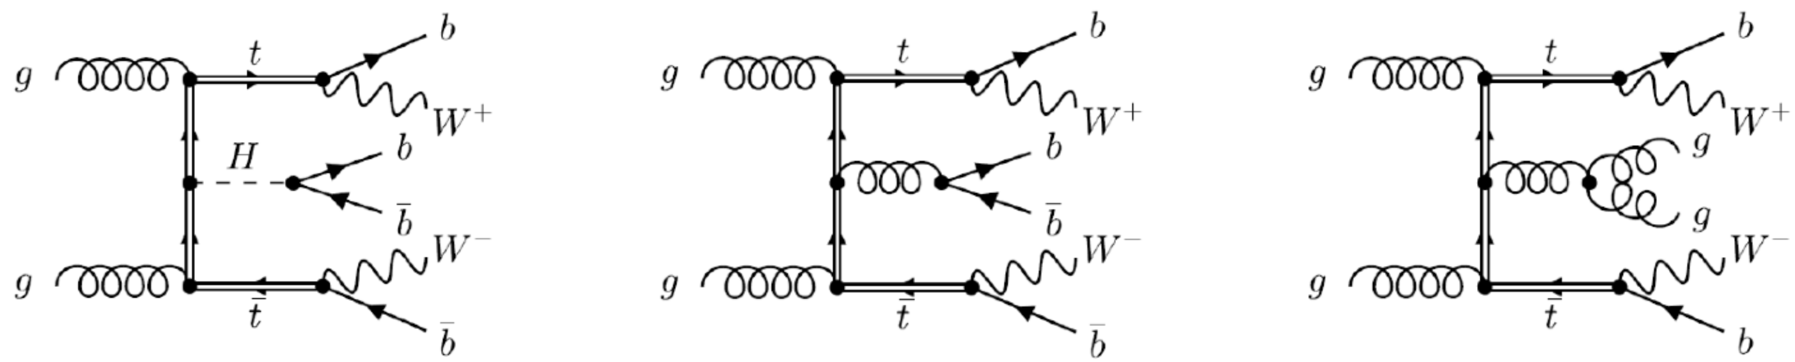
- Several $t\bar{t}$ observables are sensitive to extra-jet radiation

- $t\bar{t}+1$ jet provides one method to extract top quark mass at the LHC

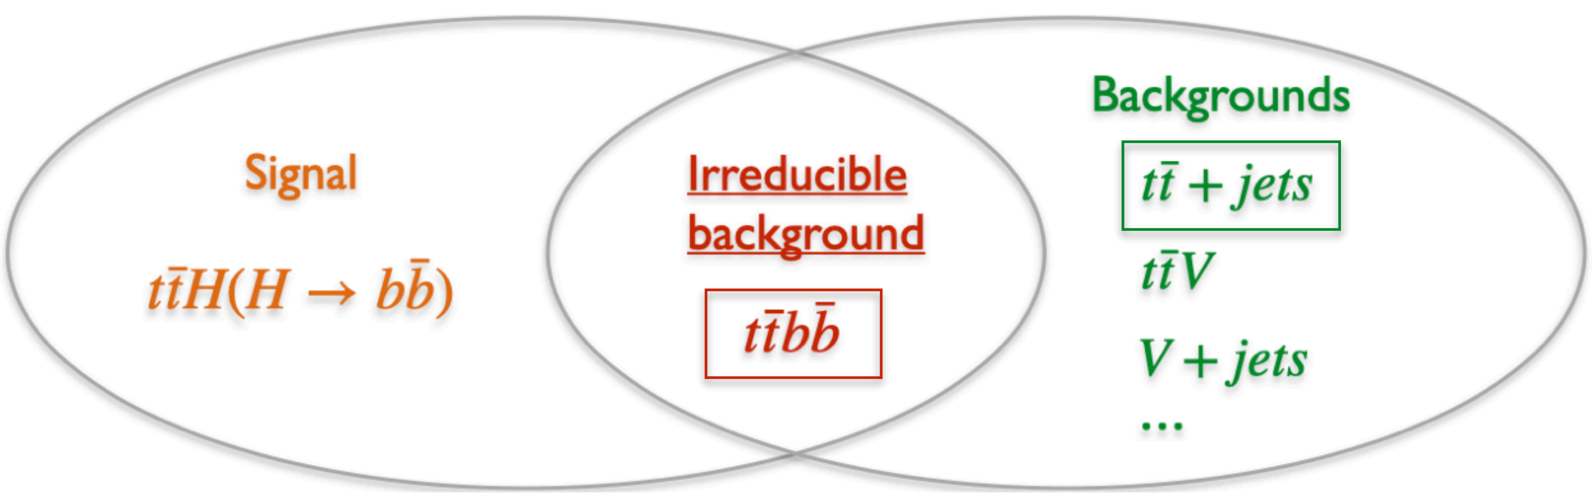
Alioli, Fuster, Irles, Moch and Uwer '13
Alioli, Fuster, Garzelli, Gavardi, Irles, Melini, Moch, Uwer and Voss '22

$t\bar{t}$+jets as a background

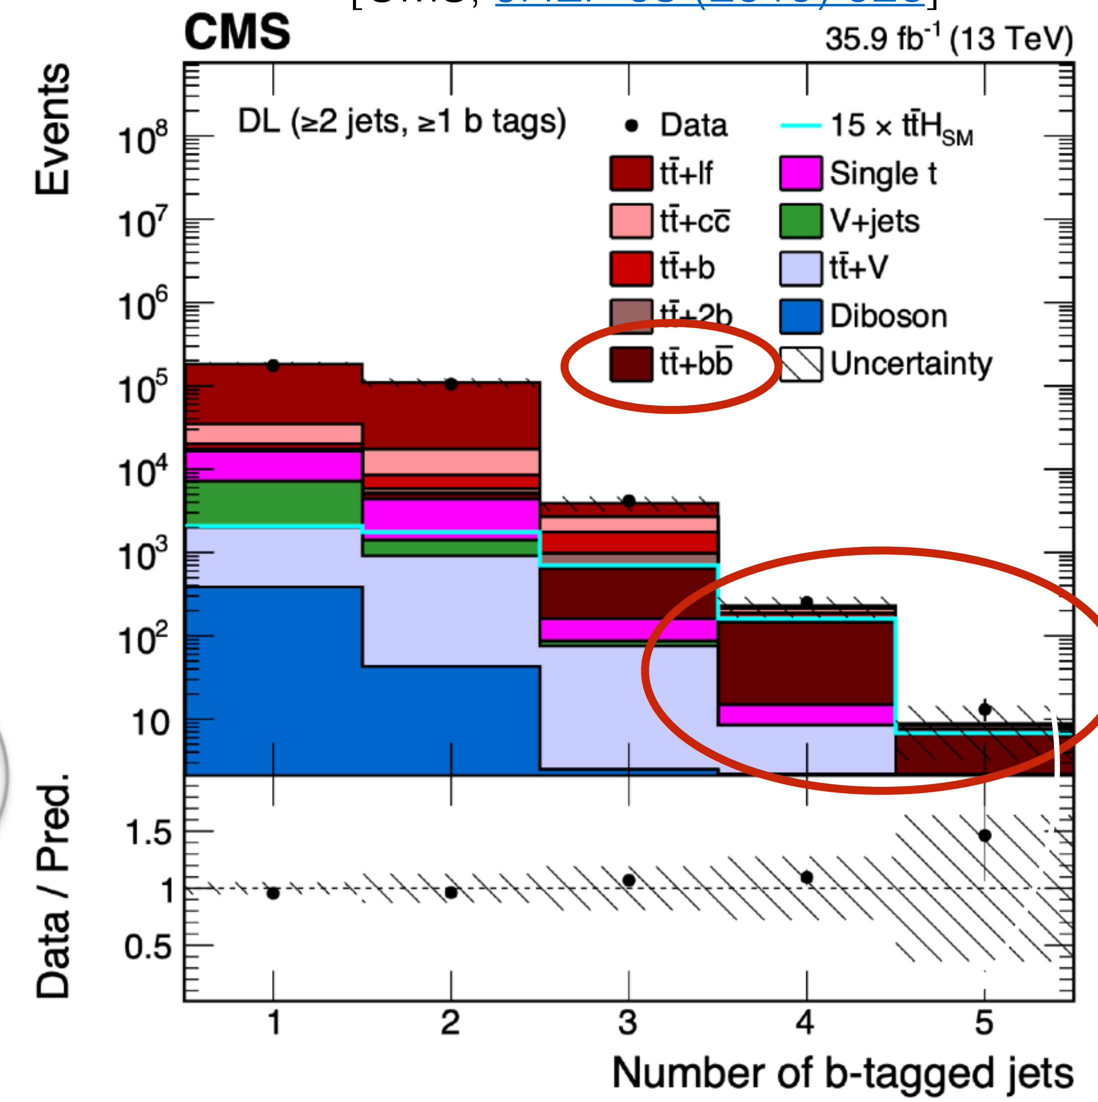
- Background to $t\bar{t}H(H \rightarrow b\bar{b})$ production (and to many BSM searches)



- $pp \rightarrow t\bar{t}H$: direct sensitivity to top Yukawa coupling
- $H \rightarrow b\bar{b}$: largest BR ($\sim 58\,\%$)
- $t\bar{t}H(H \rightarrow b\bar{b})$ is a tiny signal in a huge background



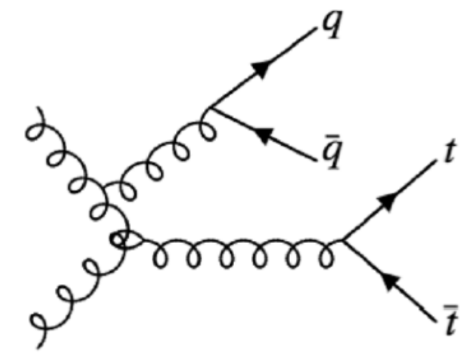
[CMS, JHEP 03 (2019) 026]



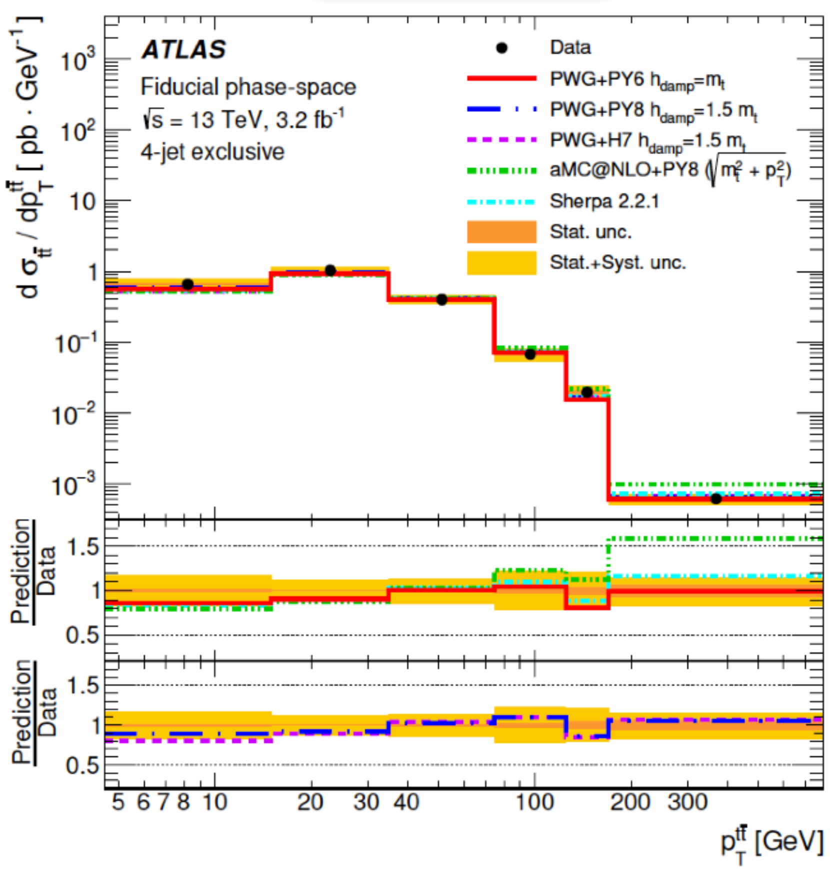
$t\bar{t}$ differential measurements (I)

[ATLAS, JHEP 10 (2018) 159]

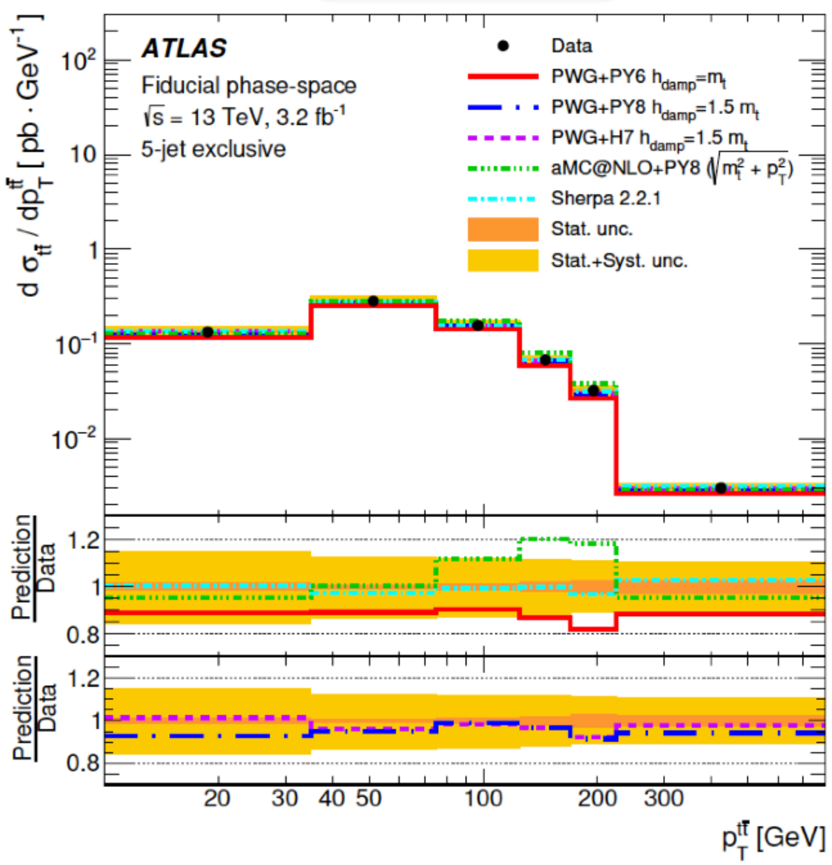
- Reconstruction of $t\bar{t}$ kinematics in ℓ+jets channel
- $t\bar{t}$ kinematics measured for different additional jet multiplicities: $N_{\text{j,add}}$
- Some observables sensitive to extra-jet radiation, e.g. $p_T(t\bar{t})$:



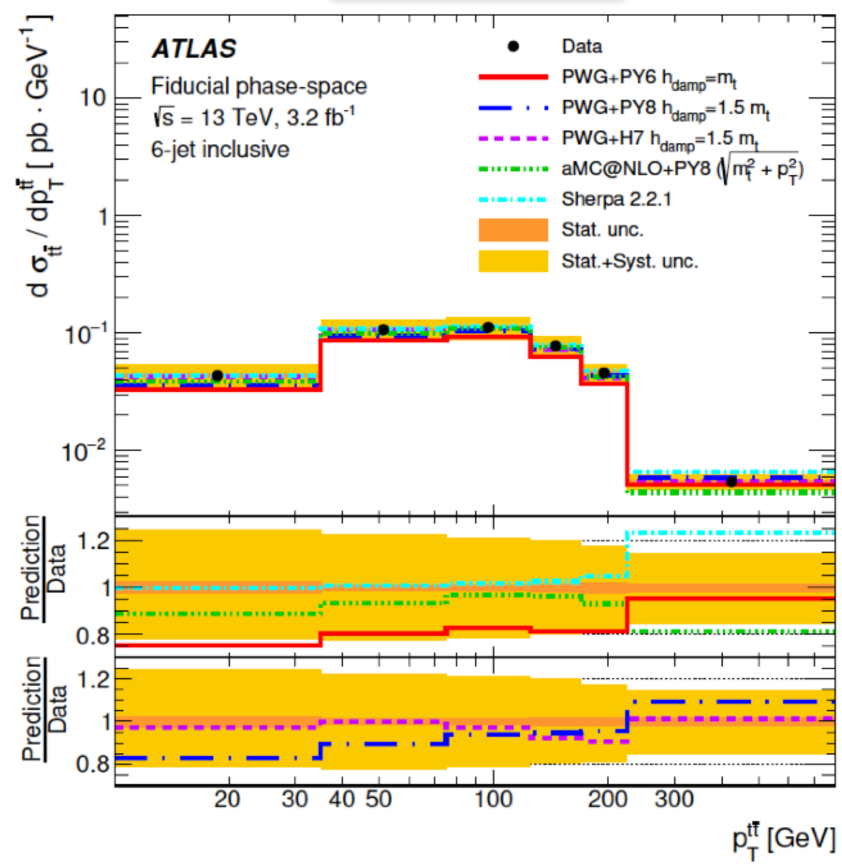
$N_{\text{j,add}} = 0$



$N_{\text{j,add}} = 1$



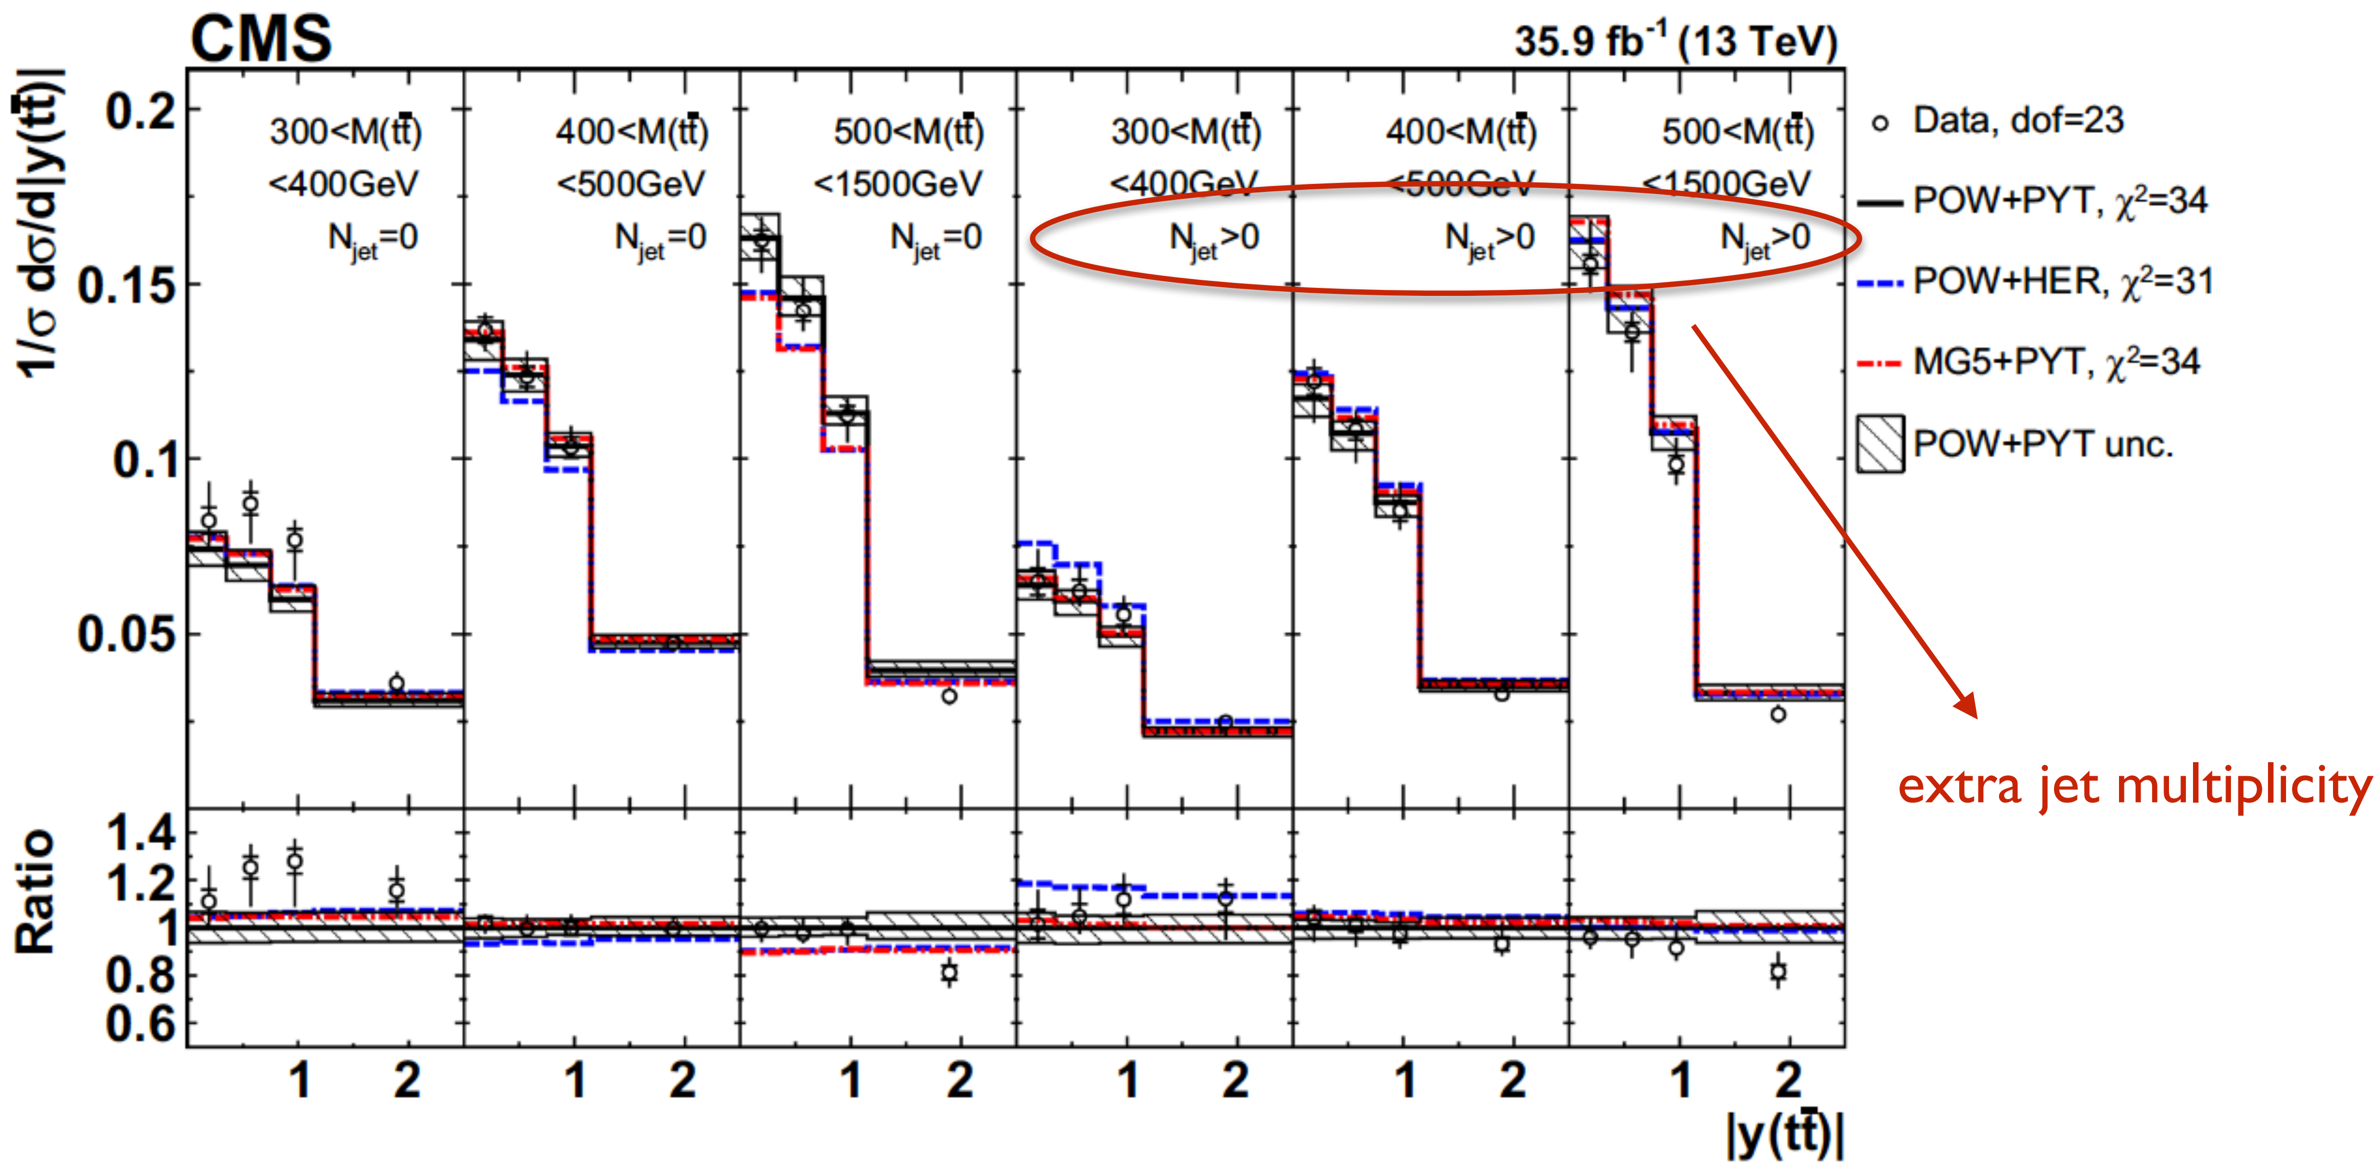
$N_{\text{j,add}} \geq 2$



$t\bar{t}$ differential measurements (II)

[CMS, EPJ C80 (2020) 658]

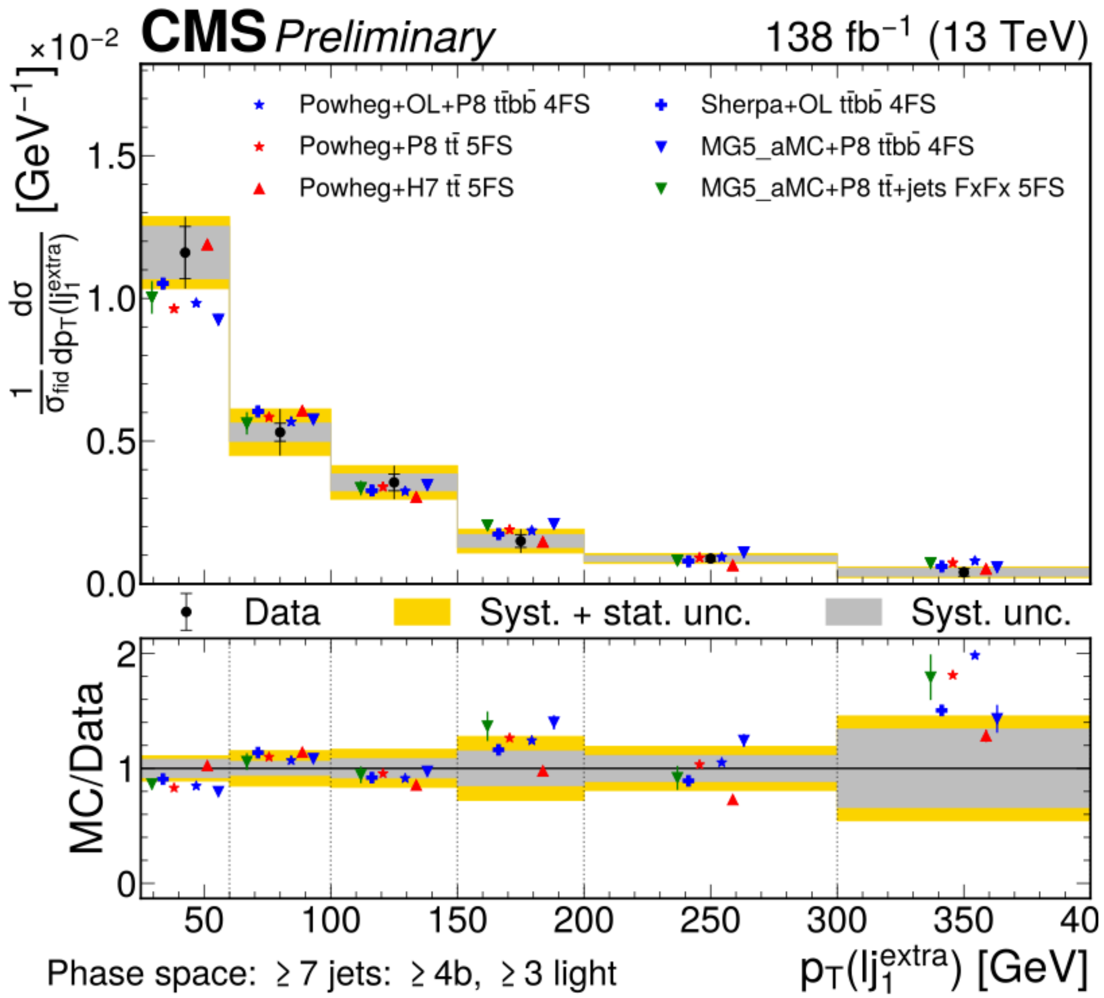
- Dilepton channel (e^+e^-, $\mu^+\mu^-$, $e^\pm\mu^\pm$)
- At least two jets in the final state; at least one of them b-tagged
- Triple-differential measurements → simultaneous extraction of α_s , m_t , PDFs

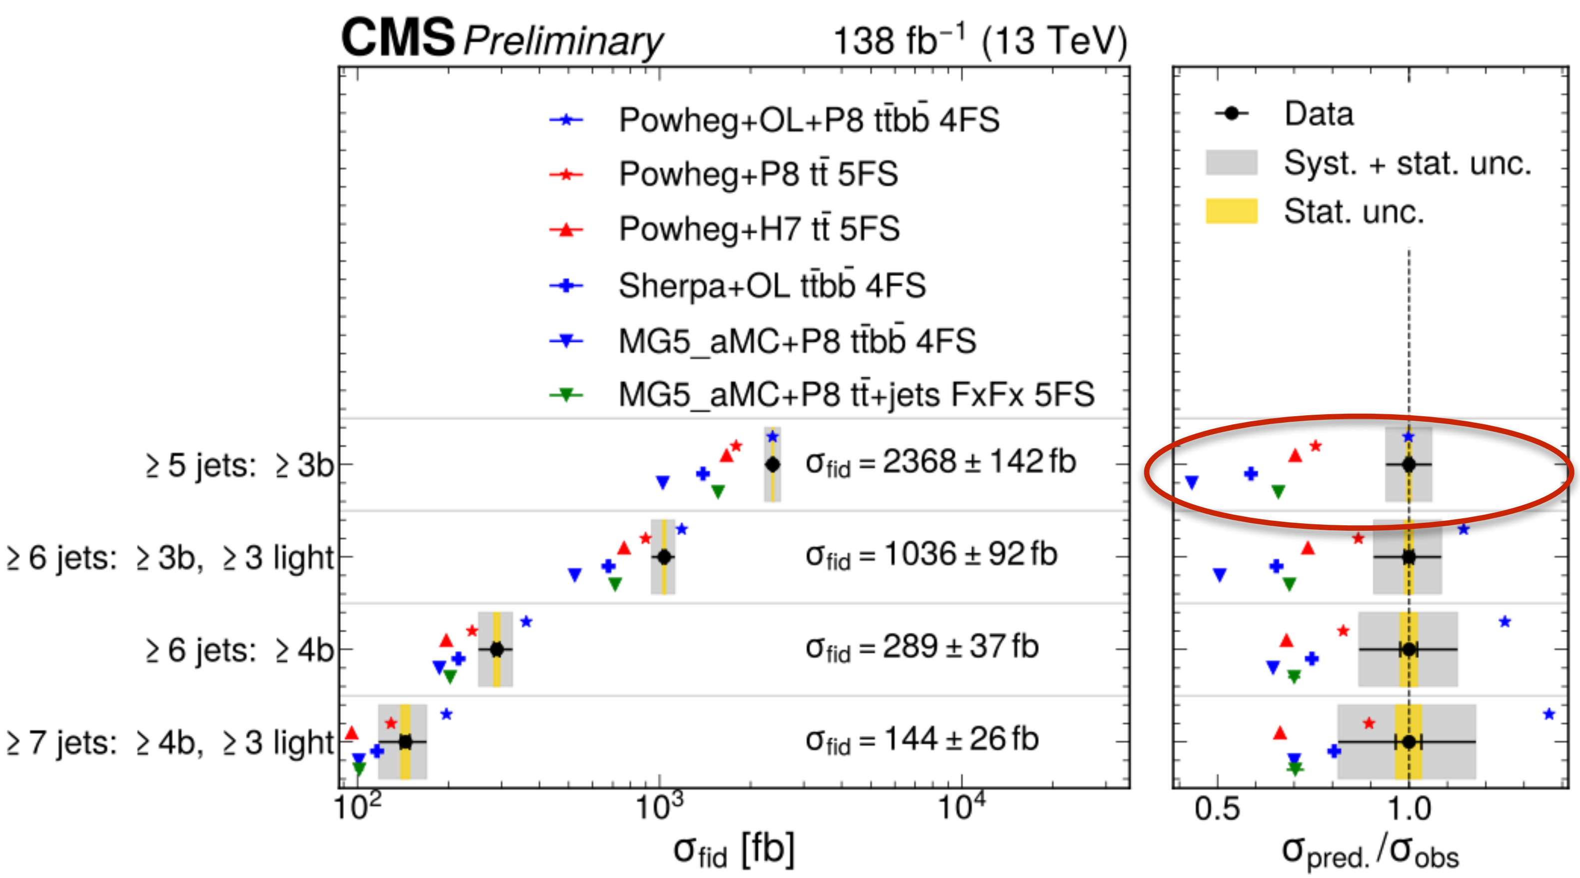


Measurements of $t\bar{t}b\bar{b}$ production

[CMS-PAS-TOP-22-009]

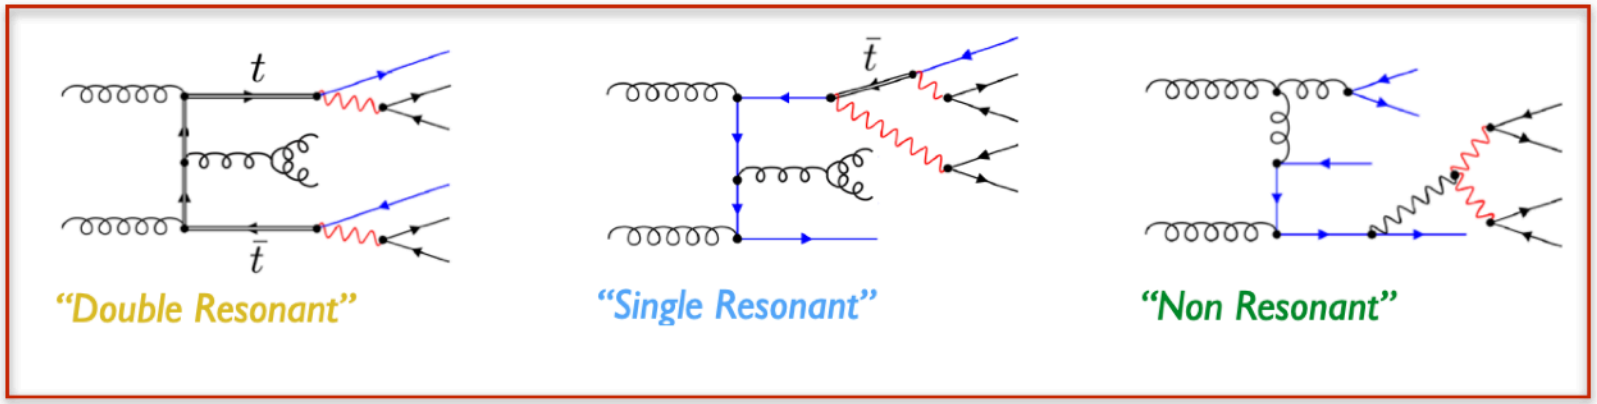
- ℓ+jets channel
- Inclusive and differential measurements $\rightarrow$ 4 fiducial regions: $5j3b$, $6j4b$, $6j3b3\ell$, $7j4b3\ell$
- Inclusive σ higher than theory predictions (consistent with previous measurements)





- ME calculations for fully decayed final states are often challenging

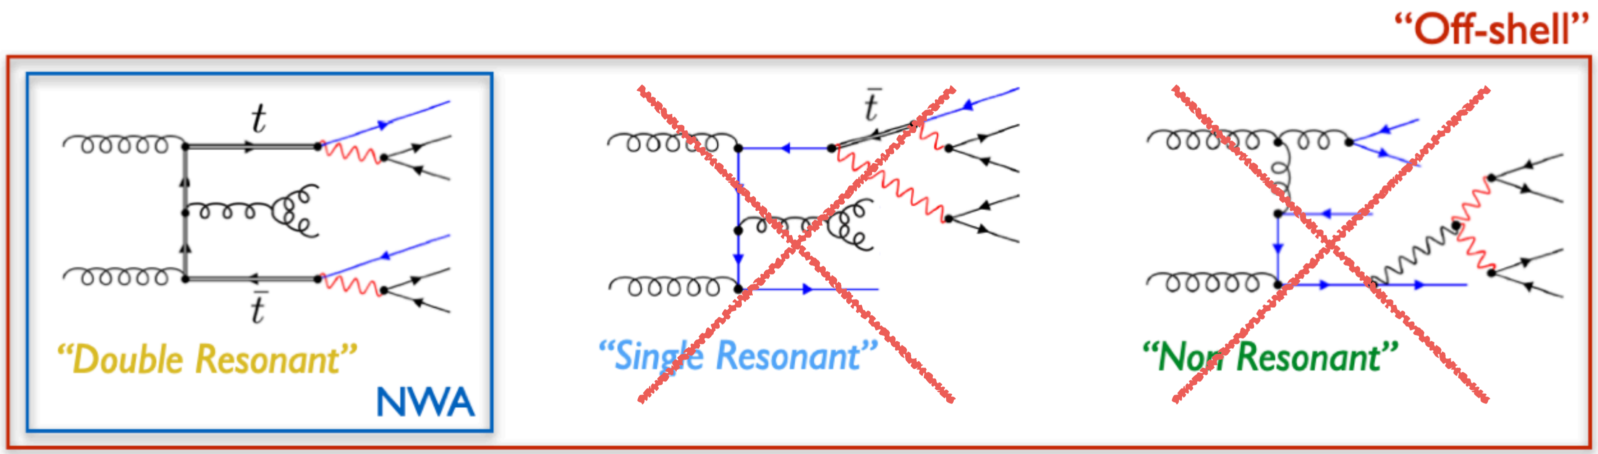
"Off-shell"



"Off-shell" = DR + SR + NR + interferences

$t\bar{t}$ + multijets at LHC: theory challenges

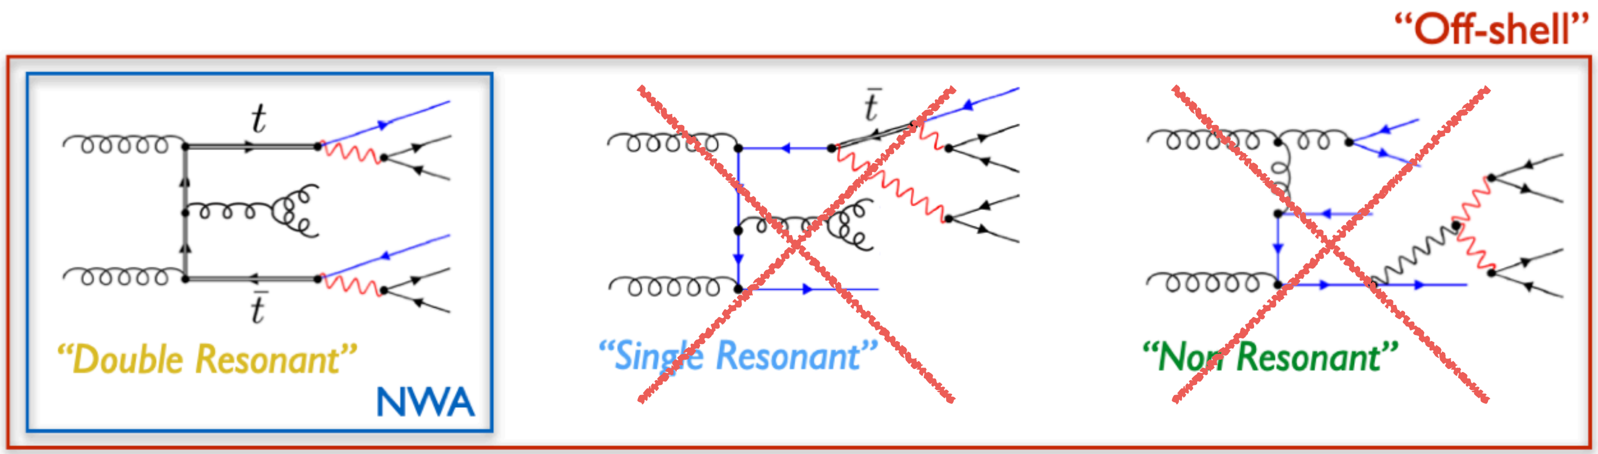
- ME calculations for fully decayed final states are often challenging $\rightarrow$ use NWA



$\Gamma_t/m_t \rightarrow 0$

$\Gamma_W/m_W \rightarrow 0$

- ME calculations for fully decayed final states are often challenging $\rightarrow$ use NWA



$\Gamma_t/m_t \rightarrow 0$

$\Gamma_W/m_W \rightarrow 0$

$$\Gamma_t/m_t \rightarrow 0 \quad \Rightarrow \quad \frac{1}{(p_t^2-m_t^2)^2+m_t^2\Gamma_t^2} \overset{\Gamma_t\to 0}{\sim} \frac{\pi}{m_t\Gamma_t}\,\delta(p_t^2-m^2)+\mathcal{O}\left(\frac{\Gamma_t}{m_t}\right)$$

- Off-shell effects are suppressed by powers of $\Gamma_t/m_t = \mathcal{O}(1\%)$ for *sufficiently inclusive* observables

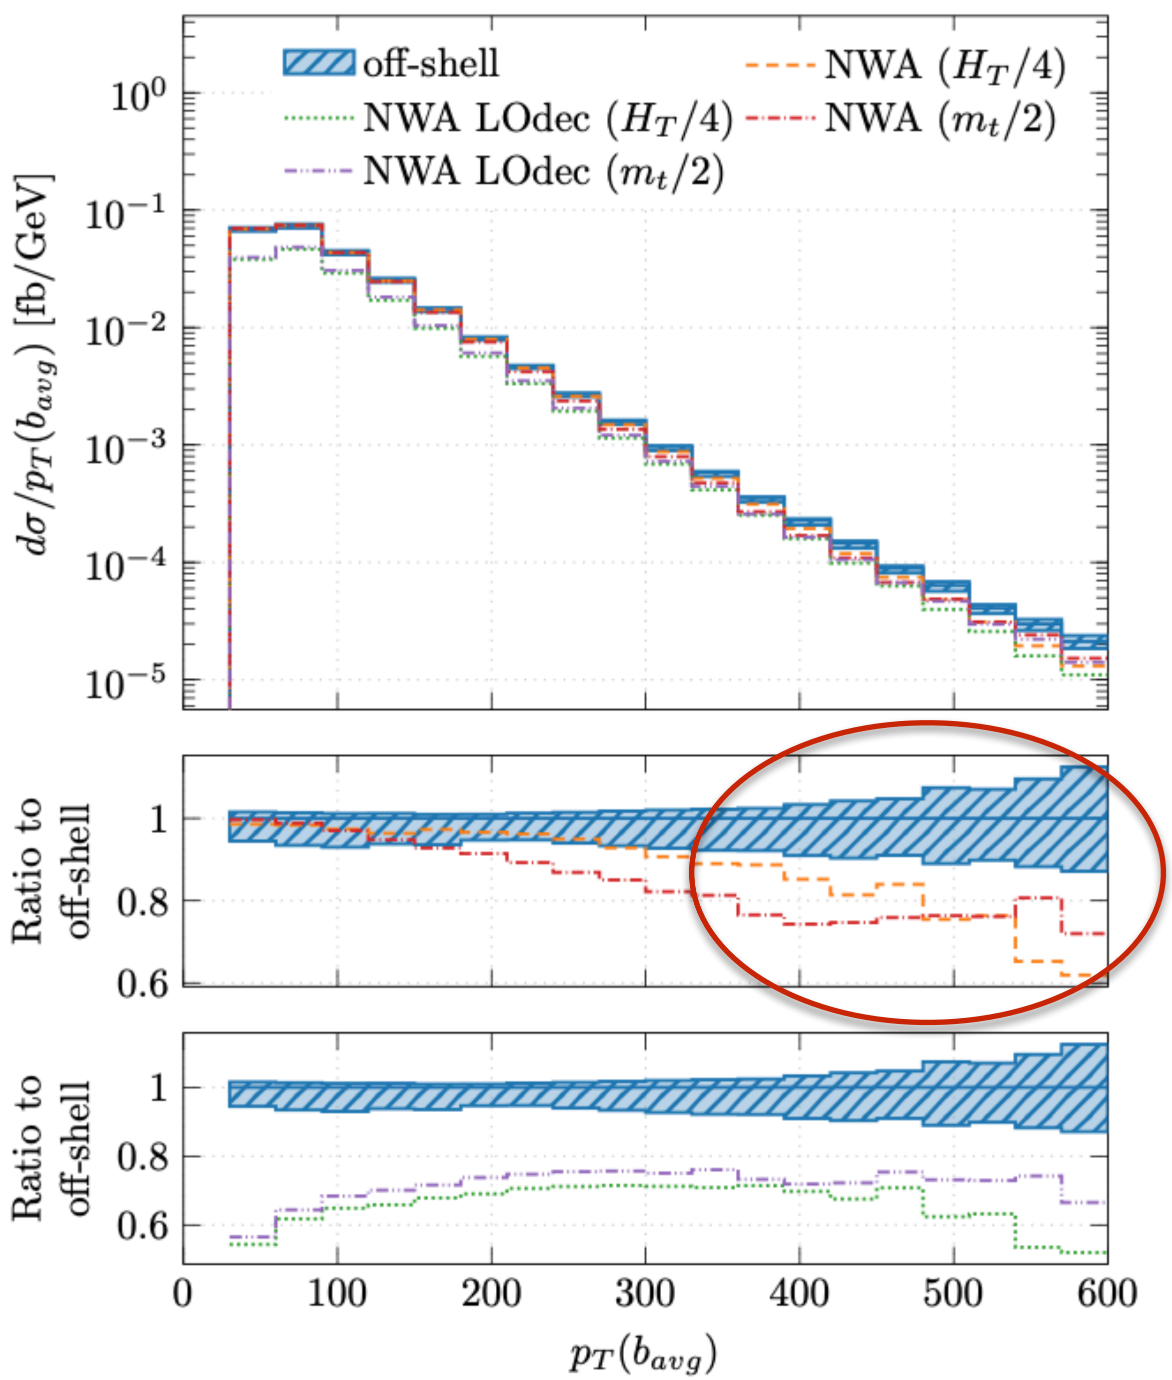
[Fadin, Khoze and Martin, Phys.Lett.B 320 (1994) 141-144]

Note: in general, this is not true at differential level

$t\bar{t}$ + multijets at LHC: theory challenges

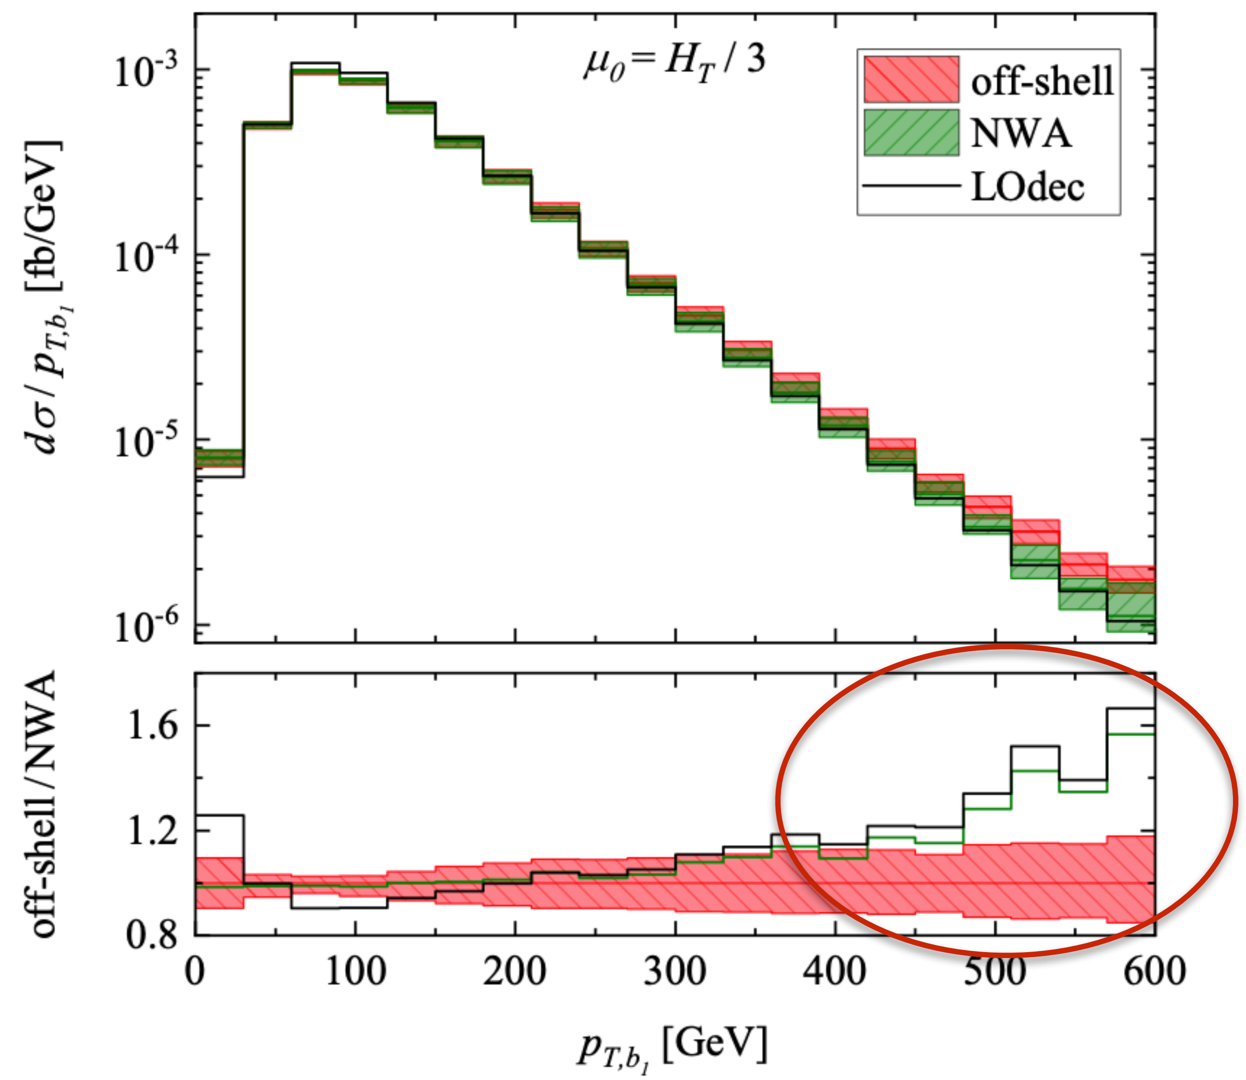
$pp \to t\bar{t}\gamma$ (dilepton)

GB, Hartanto, Kraus, Weber and Worek, JHEP 03 (2020) 154



$pp \to t\bar{t}W^{\pm}$ (dilepton)

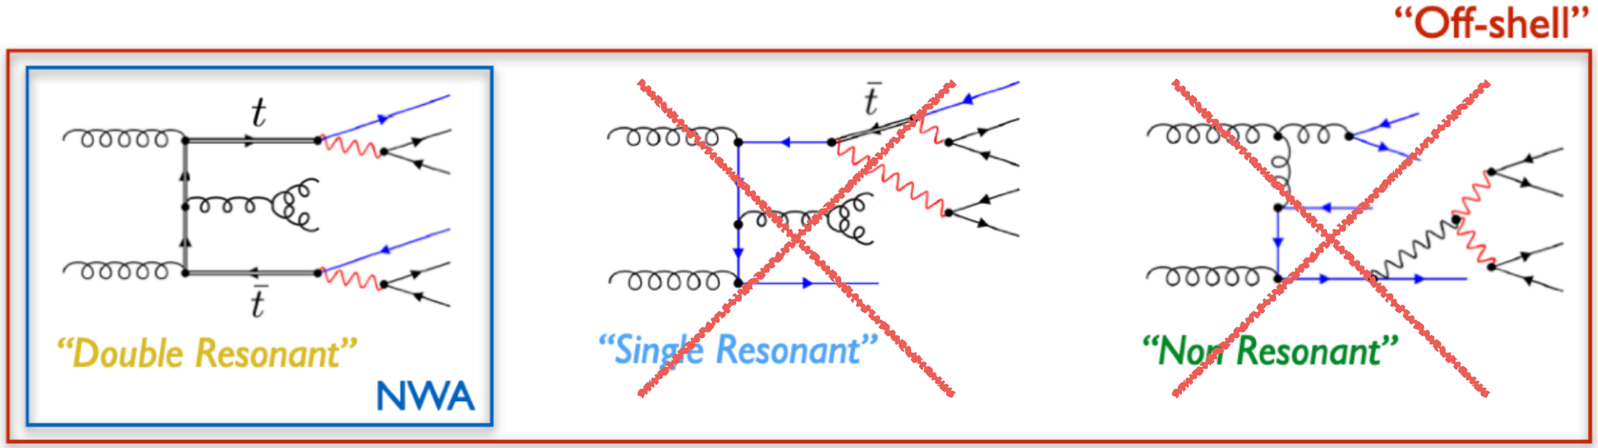
GB, Bi, Hartanto, Kraus and Worek, JHEP 08 (2020) 043



- **Off-shell effects can reach $\mathcal{O}(50\%)$ and more differentially!**

$t\bar{t}$ + multijets at LHC: theory challenges

- ME calculations for fully decayed final states are often challenging $\rightarrow$ use NWA

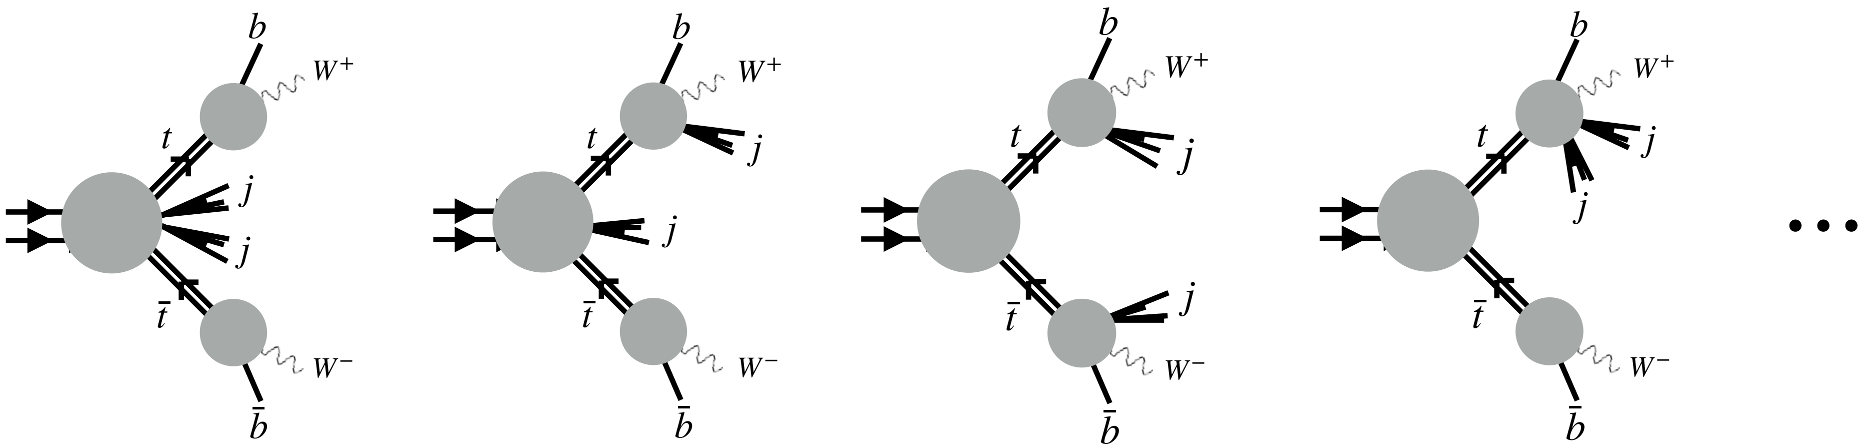


$\Gamma_t/m_t \to 0$

$\Gamma_W/m_W \to 0$

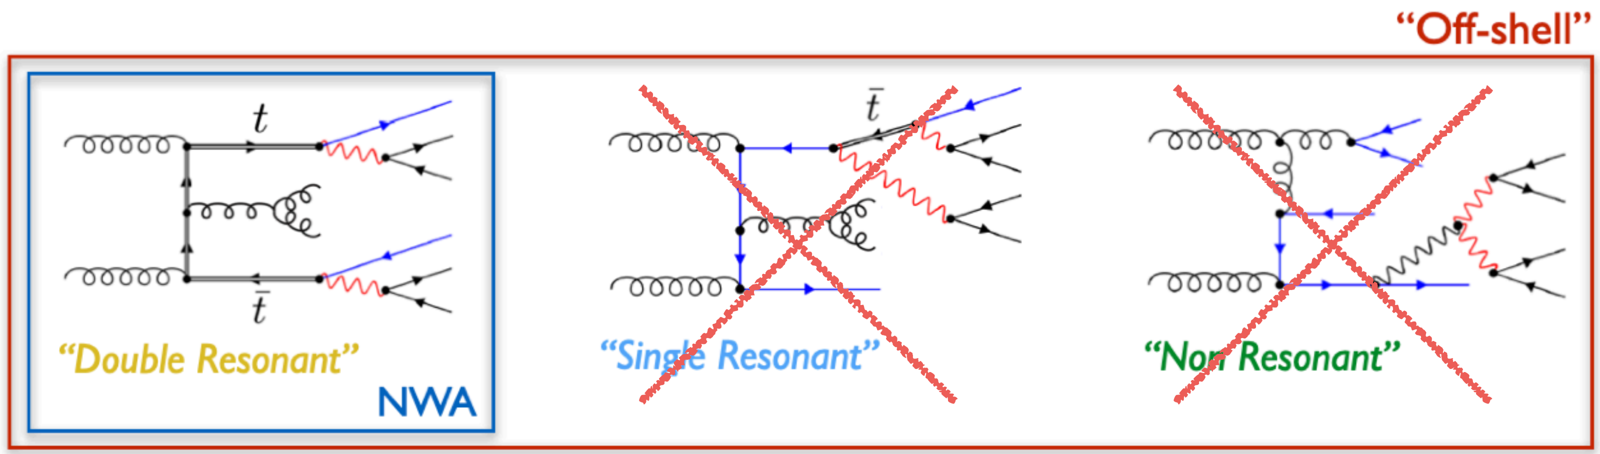
- The number of resonant structures entering the $t\bar{t} + n\,\mathrm{jets}$ cross section in NWA increases rapidly with n

e.g. : $n = 2$



$t\bar{t}$ + multijets at LHC: theory challenges

- ME calculations for fully decayed final states are often challenging $\rightarrow$ use NWA

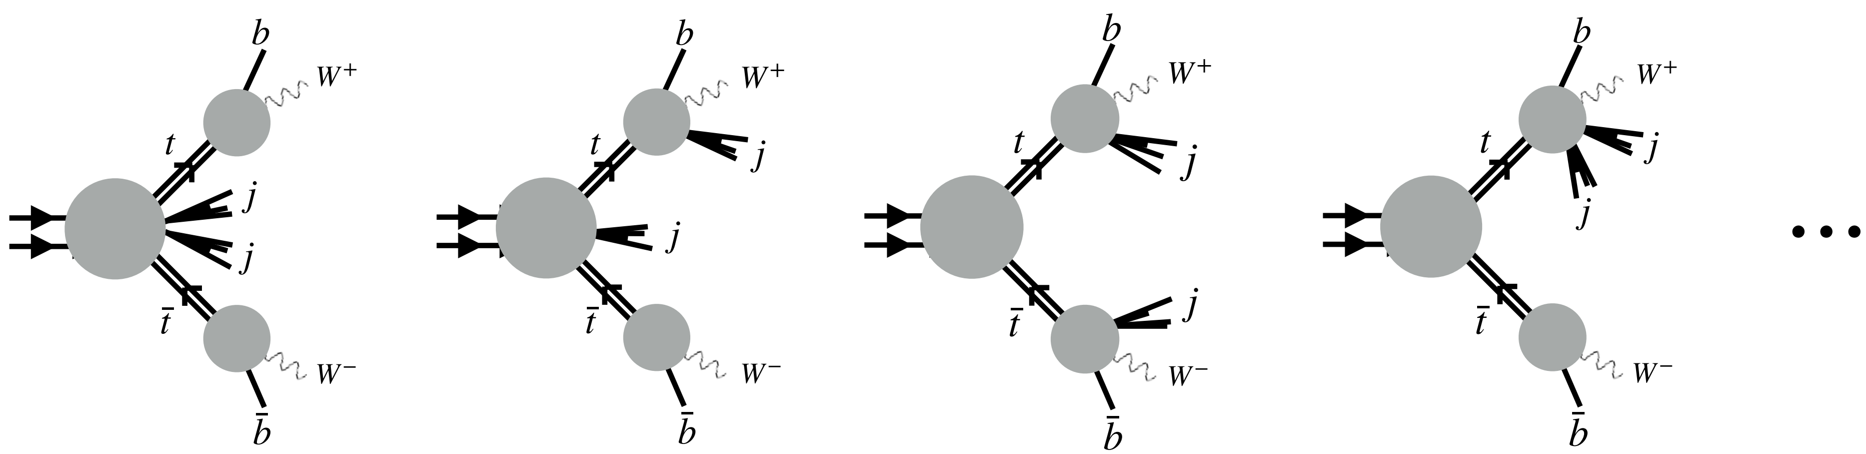


$\Gamma_t / m_t \rightarrow 0$

$\Gamma_W / m_W \rightarrow 0$

- The number of resonant structures entering the $t\bar{t} + n\,\mathrm{jets}$ cross section in NWA increases rapidly with n

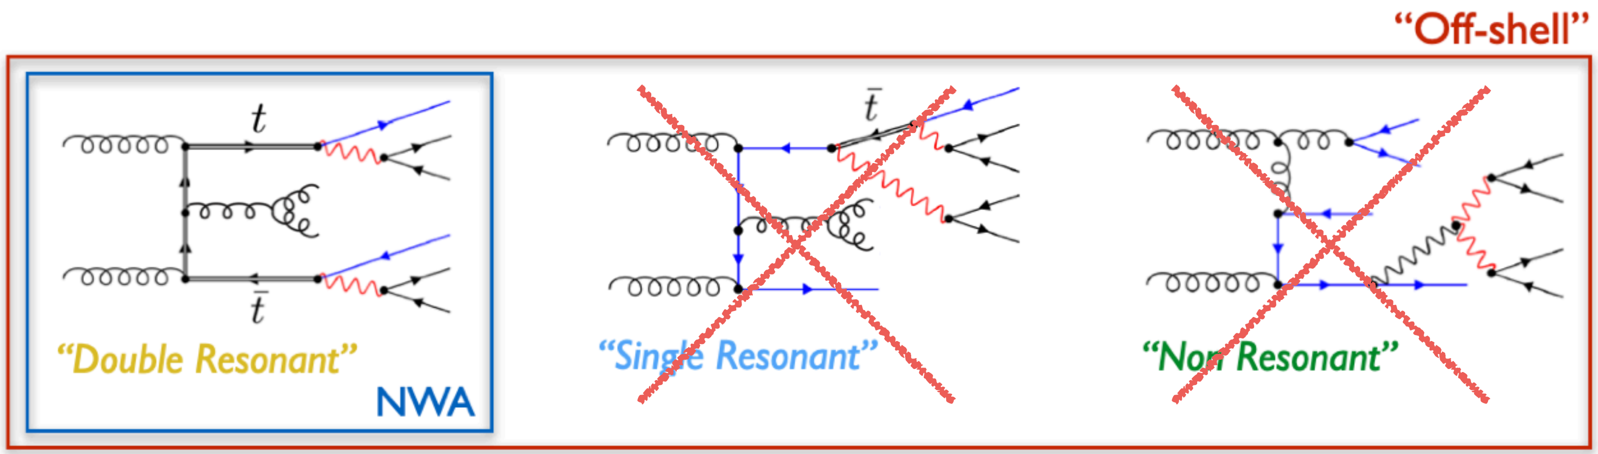
e.g. : $n = 2$



- QCD corrections to both *Production* and *Decay* ME's should be considered for accurate estimates of full NLO cross section

$t\bar{t}$ + multijets at LHC: theory challenges

- ME calculations for fully decayed final states are often challenging $\rightarrow$ use NWA

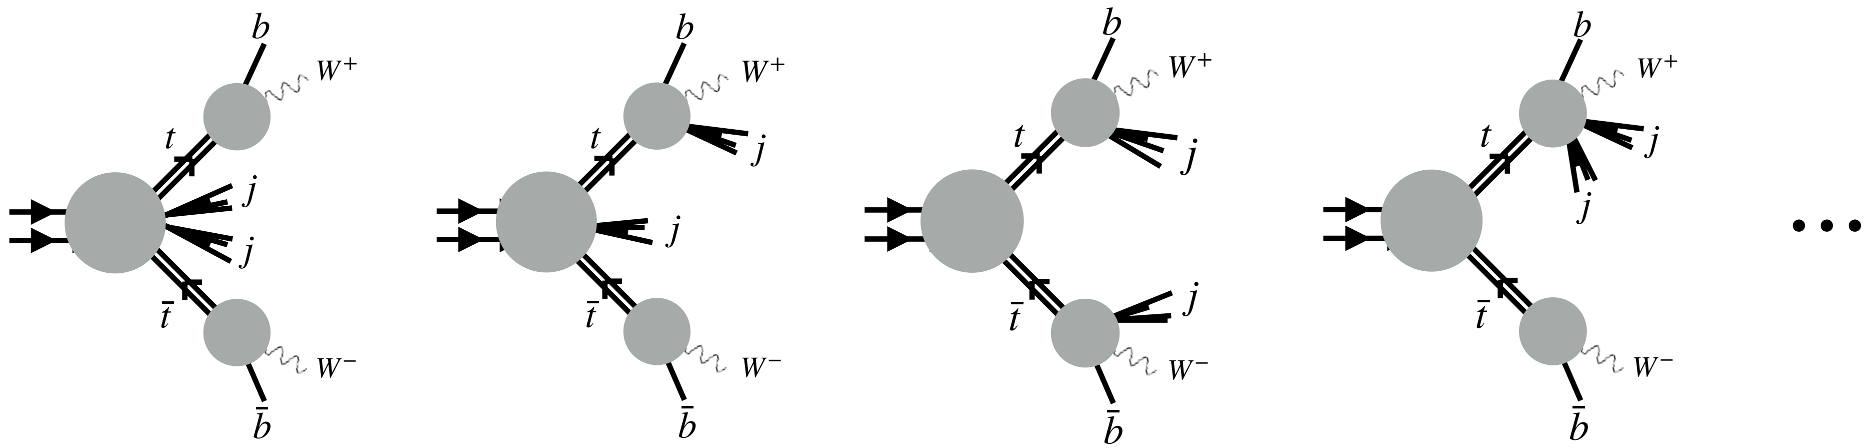


$\Gamma_t/m_t \rightarrow 0$

$\Gamma_W/m_W \rightarrow 0$

- The number of resonant structures entering the $t\bar{t} + n\,\mathrm{jets}$ cross section in NWA increases rapidly with n

e.g.: $n = 2$



- QCD corrections to both *Production* and *Decay* ME's should be considered for accurate estimates of full NLO cross section

We'll focus on the case of $t\bar{t} + 2\,\mathrm{jets}$

$t\bar{t}jj$: theory status

Stable top quarks

- $pp \to t\bar{t} + 2\,\text{jets}$ [GB, Czakon, Papadopoulos and Worek '10,'11]

↪ NLO QCD: fixed-order

- $pp \to t\bar{t} + 0{,}1{,}2{,}3\,\text{jets}$ [Höche, Maierhöfer, Moretti, Pozzorini and Siegert '17]

↪ NLO QCD: NLO vs MiNLO

Exclusive final states

- $pp \to t\bar{t} + 0{,}1{,}2\,\text{jets}$ [Höche, Krauss, Maierhöfer, Pozzorini, Schönherr and Siegert '15]

↪ NLO QCD: MEPS@NLO multi-jet merging

- $pp \to t\bar{t} + 0{,}1{,}2{,}3{,}4\,\text{jets}$ [Gütschow, Lindert and Schönherr '18]

↪ NLO QCD+EW ($n \leq 1$ jet) & LO QCD+EW ($n > 1$): MEPS@NLO multi-jet merging

$t\bar{t}bb$: theory status

Fixed order

- $pp \to t\bar{t}b\bar{b}$ → stable tops
  [Bredenstein, Denner, Dittmaier and Pozzorini '09]
  [GB, Czakon, Papadopoulos, Pittau and Worek '09]

- $pp \to t\bar{t}b\bar{b}j$ → stable tops
  [Buccioni, Kallweit, Pozzorini and Zoller '19]

- $pp \to e^+\nu_e \mu^-\bar{\nu}_\mu b\bar{b}b\bar{b}$
  ↪ Full off-shell
  [Denner, Lang and Pellen '21]
  [GB, Bi, Hartanto, Kraus, Lupattelli and Worek ''21]

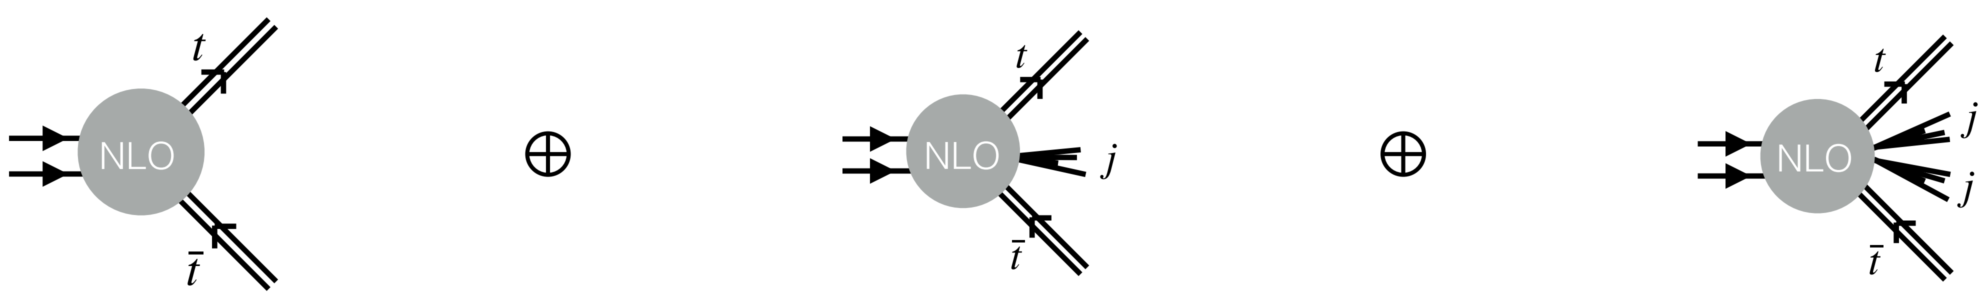
Matched to PS

- $pp \to t\bar{t}b\bar{b}$
  ↪ POWHEG matching
  [Garzelli, Kardos and Trocsanyi '14] *5FS*
  [GB, Garzelli and Kardos '17] 4FS
  [Jezo, Lindert, Moretti and Pozzorini '18] 4FS

- $pp \to t\bar{t}b\bar{b}$
  ↪ MC@NLO matching
  [Cascioli, Maierhöfer, Moretti, Pozzorini and Siegert '14] *4FS*

$t\bar{t}jj$: state-of-the-art in a nutshell

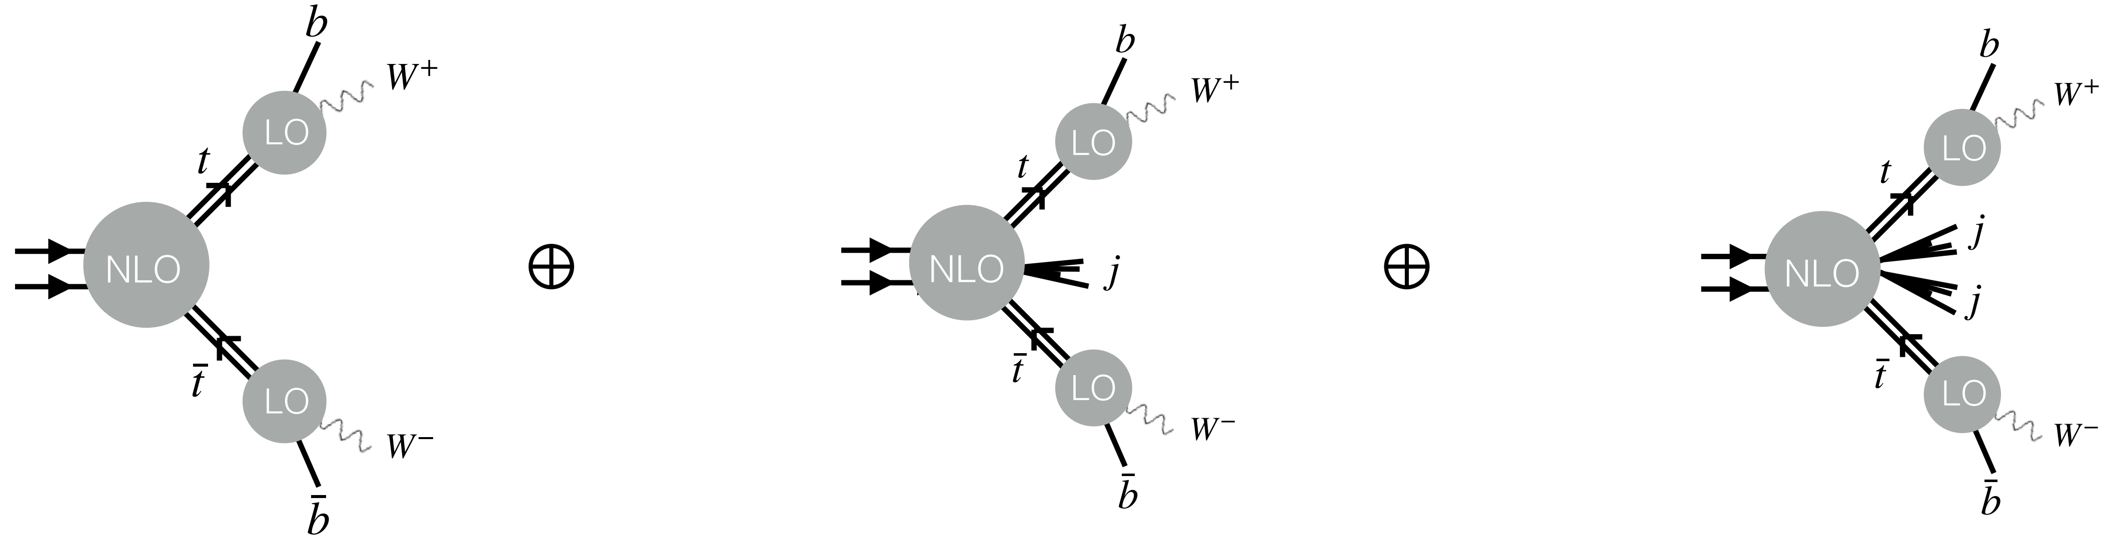
- State-of-the-art of $t\bar{t}jj$ MC simulations: NLO+PS (merging multijet samples)



$pp \to t\bar{t} + 0\,\text{jet}$ $\qquad$ $pp \to t\bar{t} + 1\,\text{jet}$ $\qquad$ $pp \to t\bar{t} + 2\,\text{jets}$

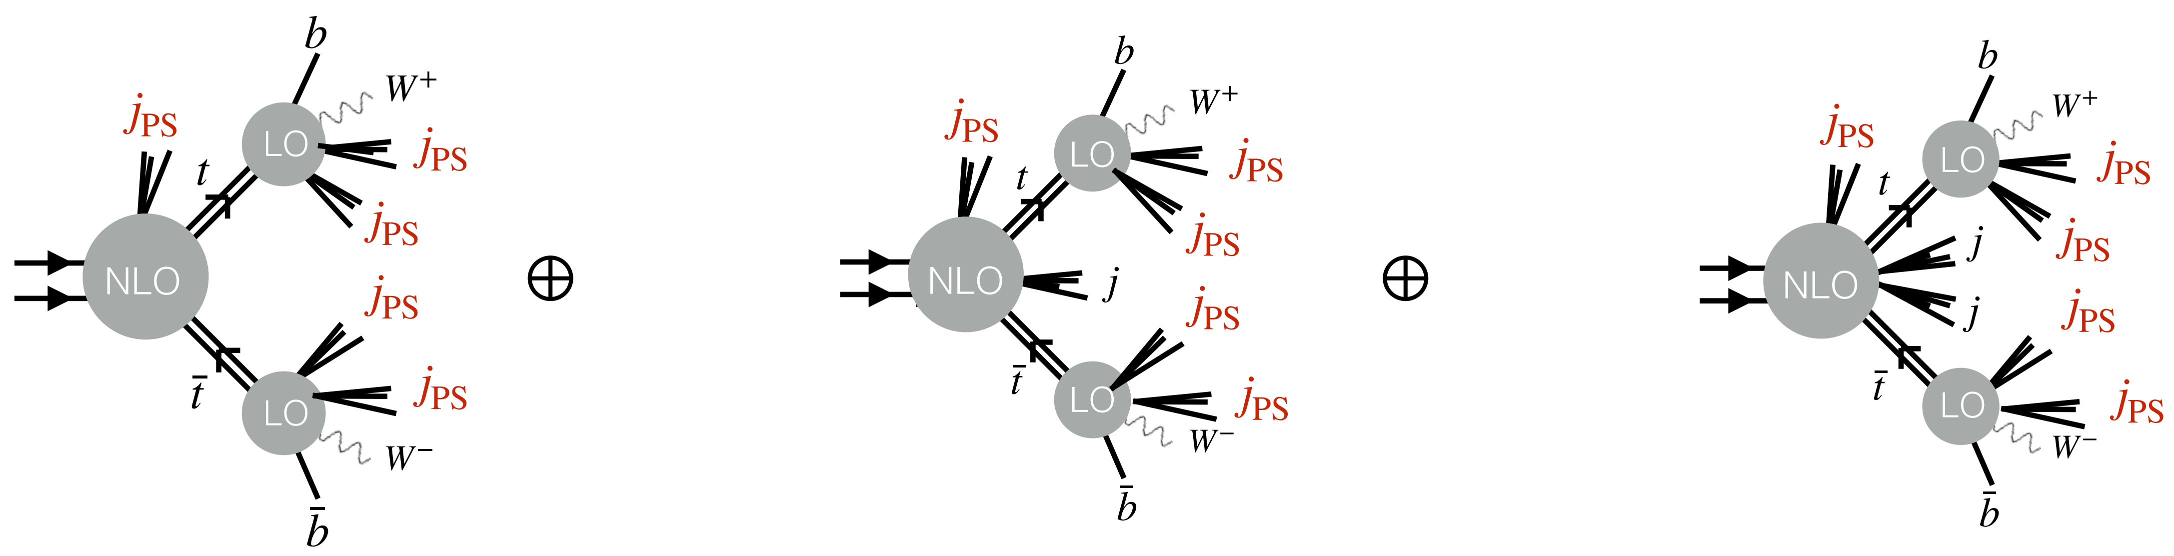
- State-of-the-art of $t\bar{t}jj$ MC simulations: NLO+PS (merging multijet samples)

- Top quarks produced on-shell and decayed at LO with spin correlations



$t\bar{t}jj$: state-of-the-art in a nutshell

- State-of-the-art of $t\bar{t}jj$ MC simulations: NLO+PS (merging multijet samples)
- Top quarks produced on-shell and decayed at LO with spin correlations
- Parton Shower evolution (ISR/FSR) accounts for additional jet activity



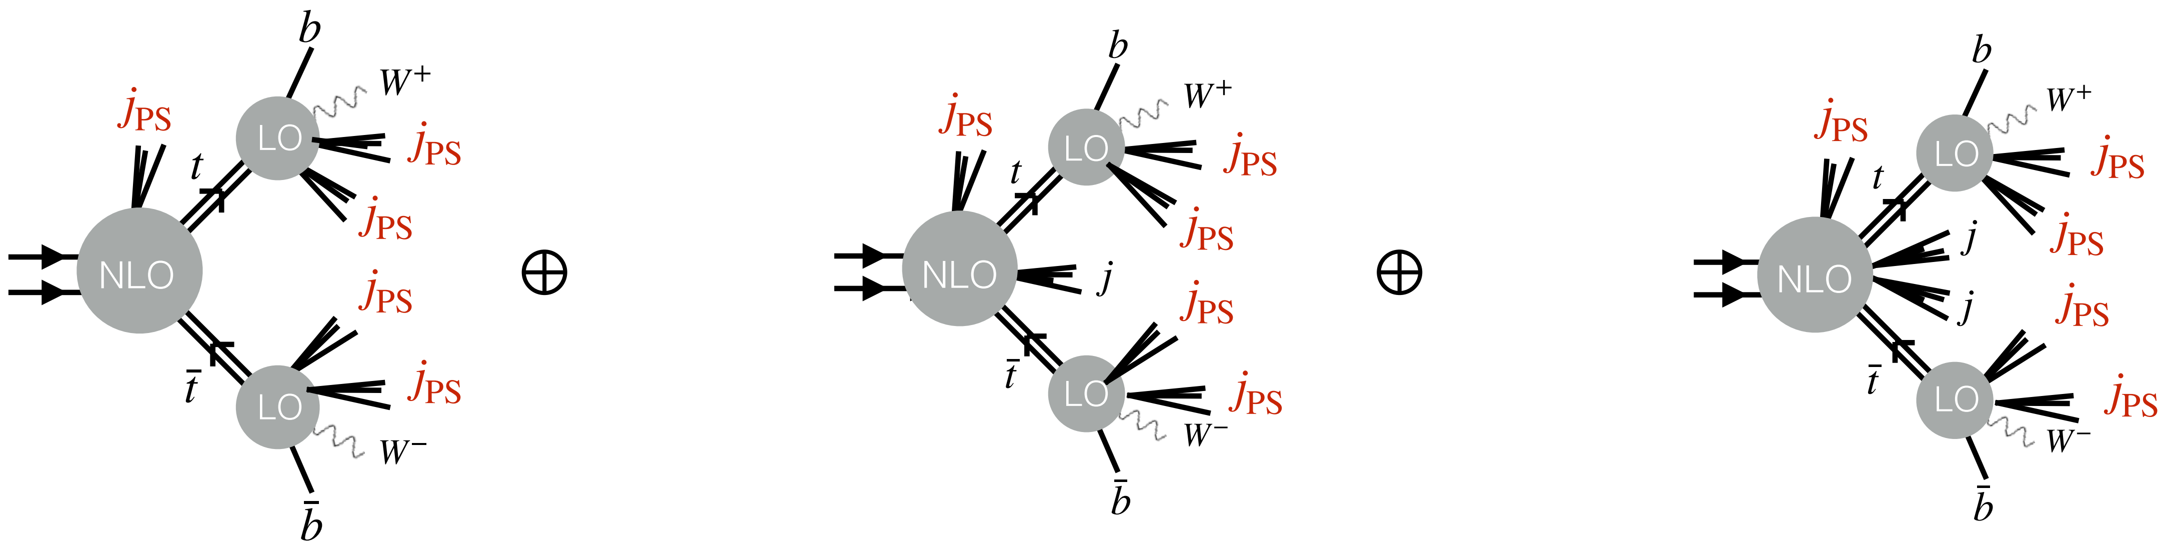
$t\bar{t}jj$: state-of-the-art in a nutshell

Some interesting questions

I. To what extent do QCD corrections to decays impact fiducial cross sections?
→ normalisation

II. Which phase space regions are more sensitive to radiation off decays?
→ shapes

III. What's the impact of full off-shell effects? → shapes, normalisation



Outline

- NLO QCD analysis of $pp \to t\bar{t}jj$ (dilepton) — *NWA*

  - Anatomy of resonant contributions at NLO QCD
  - Effects of hard radiation off top quark decays

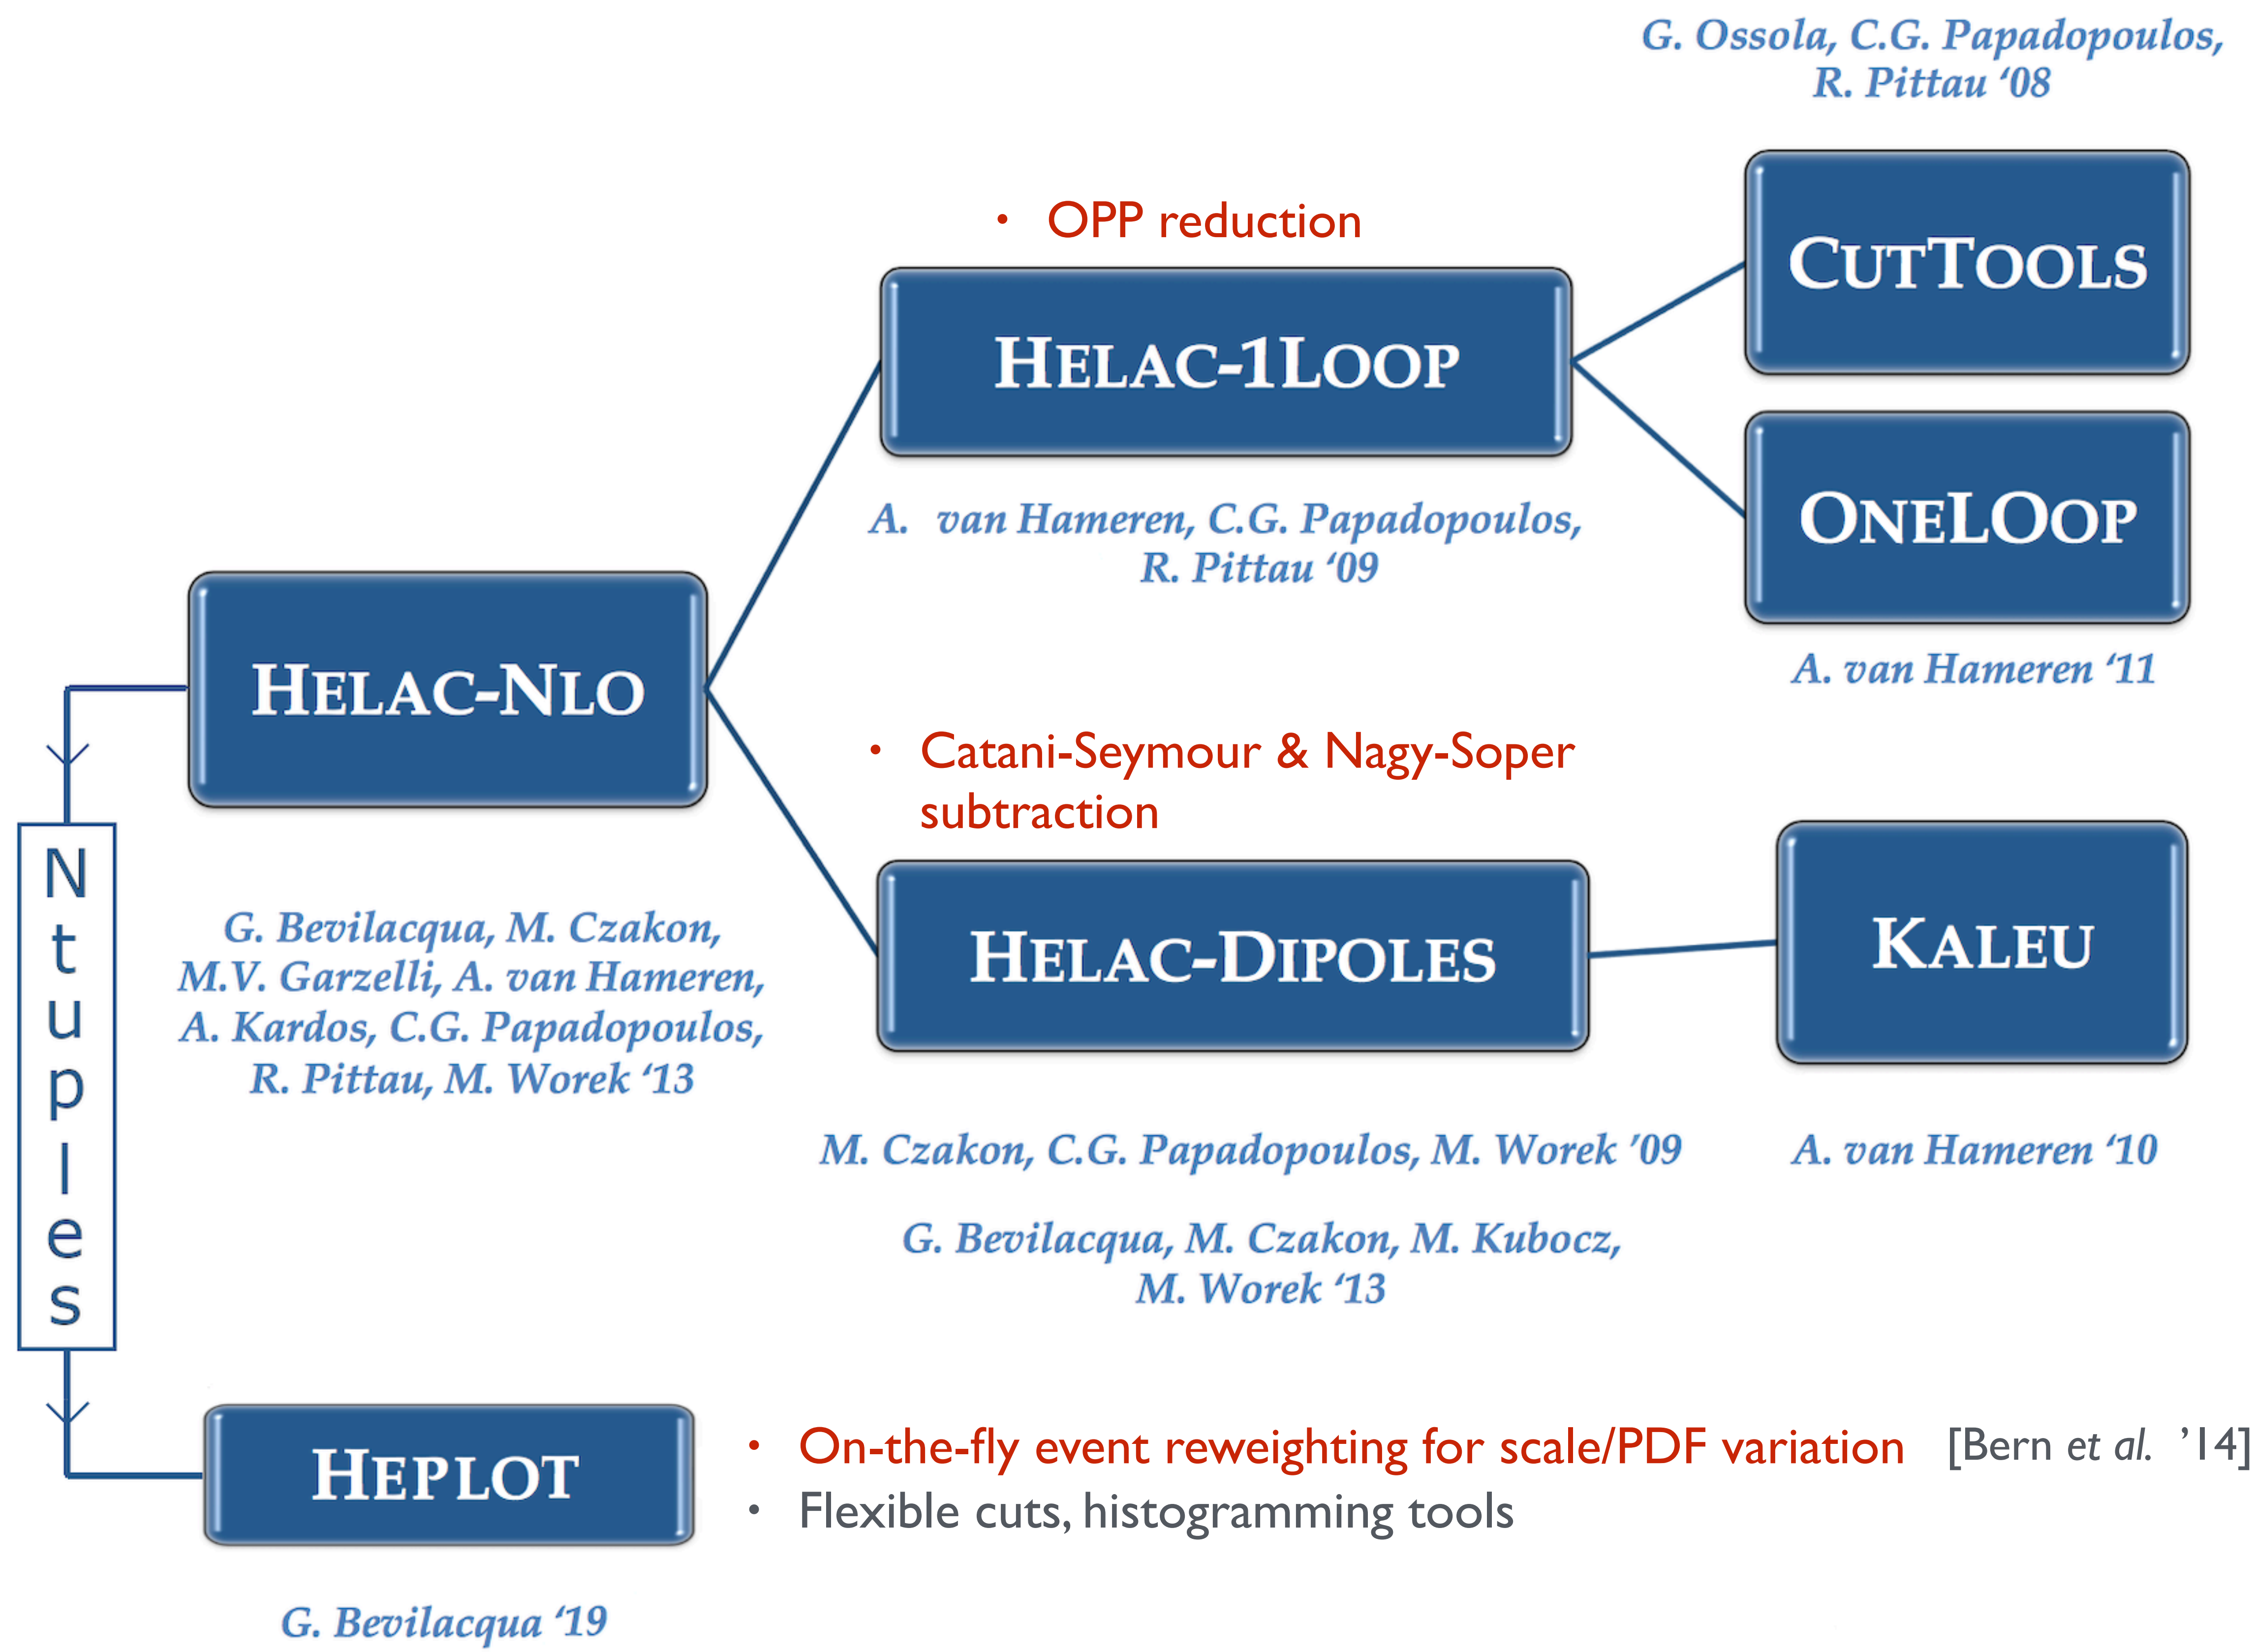
- NLO QCD analysis of $pp \to t\bar{t}b\bar{b}$ (dilepton) — *full off-shell*

  - Impact of genuine off-shell effects
  - Categorization of prompt b-jets

Results obtained with the HELAC-NLO framework

[GB, Czakon, Garzelli, van Hameren, Kardos, Papadopoulos, Pittau and Worek '13]

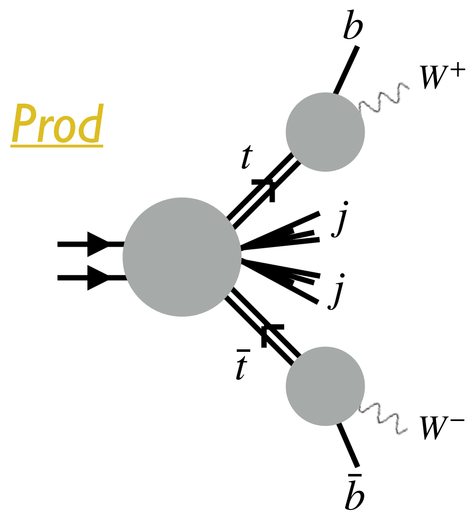
Computational framework

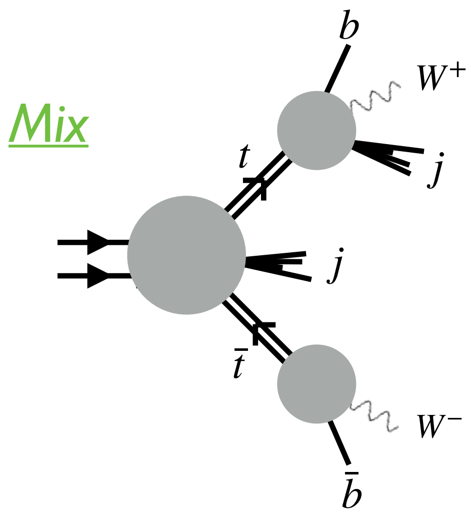


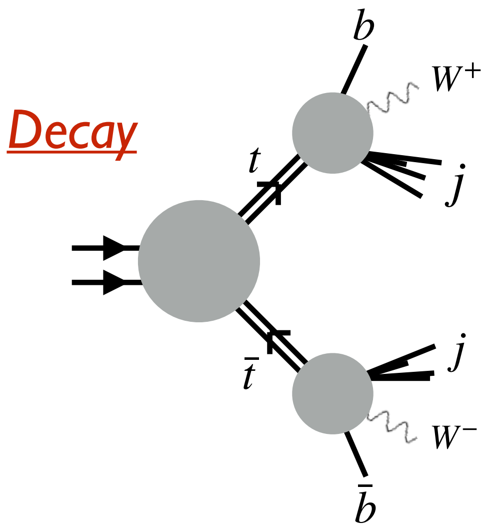
I. A study of jet activity in $t\bar{t}jj$ at the LHC

Resonant contributions to $t\bar{t}jj$ in NWA: **LO**

$$d\sigma^{\rm LO}_{t\bar{t}jj} = \Gamma_t^{-2}\Big(\underbrace{d\sigma^{\rm LO}_{t\bar{t}jj}\, d\Gamma^{\rm LO}_{t\bar{t}}}_{\text{Prod.}} + \underbrace{d\sigma^{\rm LO}_{t\bar{t}j}\, d\Gamma^{\rm LO}_{t\bar{t}j}}_{\text{Mix}} + \underbrace{d\sigma^{\rm LO}_{t\bar{t}}\, d\Gamma^{\rm LO}_{t\bar{t}jj}}_{\text{Decay}}\Big)$$







Resonant contributions to $t\bar{t}jj$ in NWA: **NLO**

$$
\begin{aligned}
d\sigma^{\rm NLO}_{t\bar t jj} = \Gamma_t^{-2}\Big(& \overbrace{\left(d\sigma^{\rm LO}_{t\bar t jj} + d\sigma^{\rm virt}_{t\bar t jj} + d\sigma^{\rm real}_{t\bar t jjj}\right) d\Gamma^{\rm LO}_{t\bar t}}^{\rm Prod.} + \overbrace{d\sigma^{\rm LO}_{t\bar t}\left(d\Gamma^{\rm LO}_{t\bar t jj} + d\Gamma^{\rm virt}_{t\bar t jj} + d\Gamma^{\rm real}_{t\bar t jjj}\right)}^{\rm Decay} \\
& \underbrace{+ d\sigma^{\rm LO}_{t\bar t j}\, d\Gamma^{\rm LO}_{t\bar t j} + d\sigma^{\rm LO}_{t\bar t jj}\, d\Gamma^{\rm virt}_{t\bar t} + d\sigma^{\rm virt}_{t\bar t}\, d\Gamma^{\rm LO}_{t\bar t jj} + d\sigma^{\rm virt}_{t\bar t j}\, d\Gamma^{\rm LO}_{t\bar t j} + d\sigma^{\rm LO}_{t\bar t j}\, d\Gamma^{\rm virt}_{t\bar t j} + d\sigma^{\rm real}_{t\bar t jj}\, d\Gamma^{\rm real}_{t\bar t j} + d\sigma^{\rm real}_{t\bar t j}\, d\Gamma^{\rm real}_{t\bar t jj}}_{\rm Mix}\Big)
\end{aligned}
$$

$\rm NWA_{prod,\,exp}$	12.25(1)	$^{+2.87\ (23\%)}_{-2.86\ (23\%)}$	−6.9%
$\rm NWA_{prod,\,LOdec}$	13.11(1)	$^{+3.74\ (29\%)}_{-3.28\ (25\%)}$	−0.4%

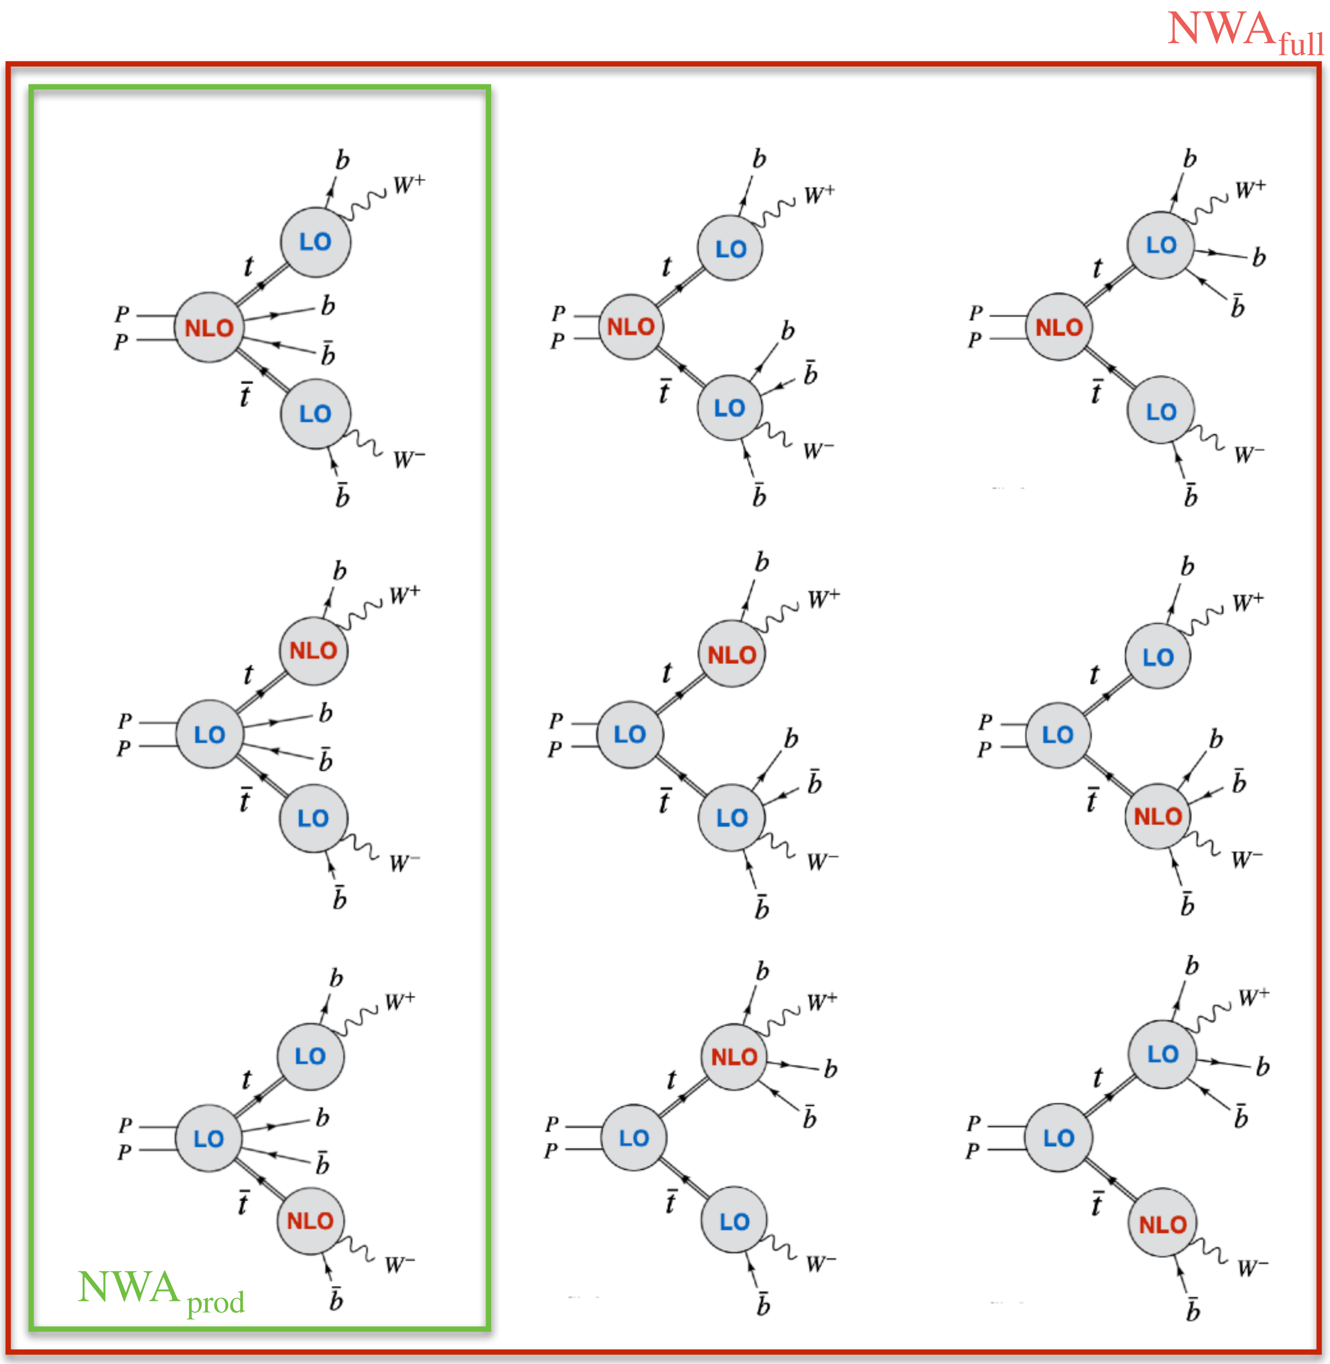
- $\rm NWA_{full}$ vs $\rm NWA_{prod}$:

↪ Impact of $t \to Wbb\bar{b}$ decays: $+1\ \%$

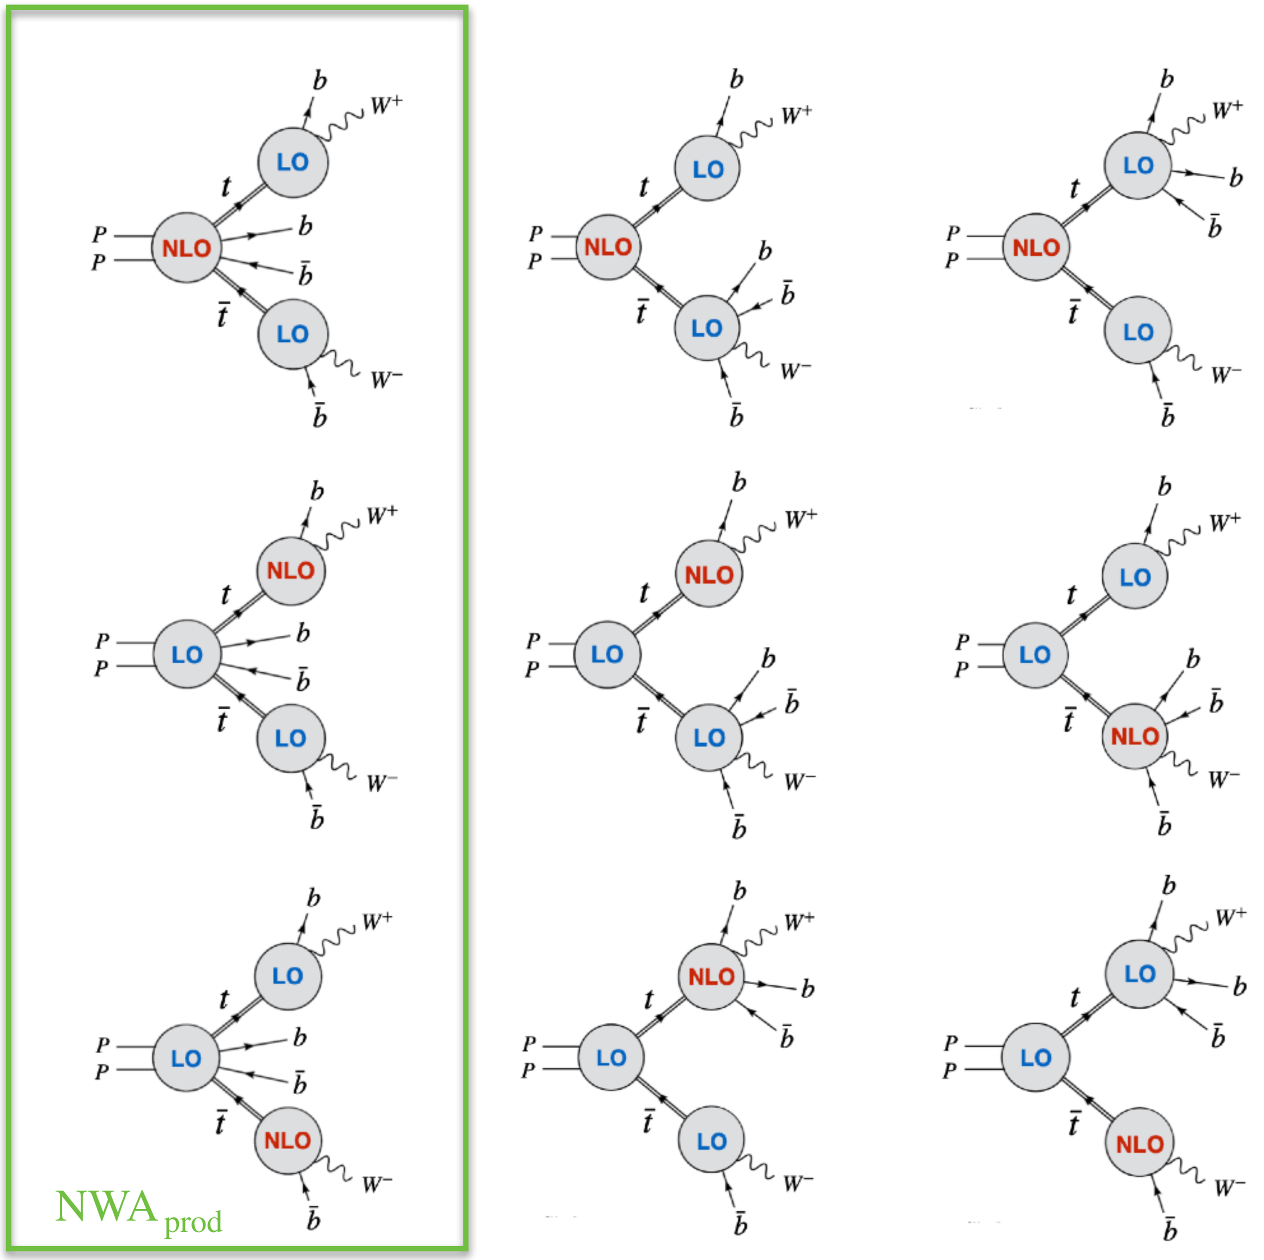


$t\bar{t}b\bar{b}$: comparing modelling approaches

[GB, Bi, Hartanto, Kraus, Lupattelli and Worek, Phys. Rev. D (107) 2023]

- *Full off-shell* vs NWA

Modelling	$\sigma^{\rm NLO}$ [fb]	$\delta_{\rm scale}$ [fb]	$\frac{\sigma^{\rm NLO}}{\sigma^{\rm NLO}_{\rm NWA_{full}}} - 1$
Off-shell	13.22(2)	$^{+2.65\ (20\%)}_{-2.96\ (22\%)}$	+0.5%
$\rm NWA_{full}$	13.16(1)	$^{+2.61\ (20\%)}_{-2.93\ (22\%)}$	–
$\rm NWA_{LOdec}$	13.22(1)	$^{+3.77\ (29\%)}_{-3.31\ (25\%)}$	+0.5%
$\rm NWA_{prod}$	13.01(1)	$^{+2.58\ (20\%)}_{-2.89\ (22\%)}$	−1.1%
$\rm NWA_{prod,\,exp}$	12.25(1)	$^{+2.87\ (23\%)}_{-2.86\ (23\%)}$	−6.9%
$\rm NWA_{prod,\,LOdec}$	13.11(1)	$^{+3.74\ (29\%)}_{-3.28\ (25\%)}$	−0.4%



- $\rm NWA_{prod}$ vs $\rm NWA_{prod,exp}$:

↪ Impact of Γ_t^{NLO} expansion: $+6\,\%$

$\mathcal{O}(\alpha_s^2)$ effects (within NLO scale uncertainty)

$t\bar{t}b\bar{b}$: comparing modelling approaches

[GB, Bi, Hartanto, Kraus, Lupattelli and Worek, Phys. Rev. D (107) 2023]

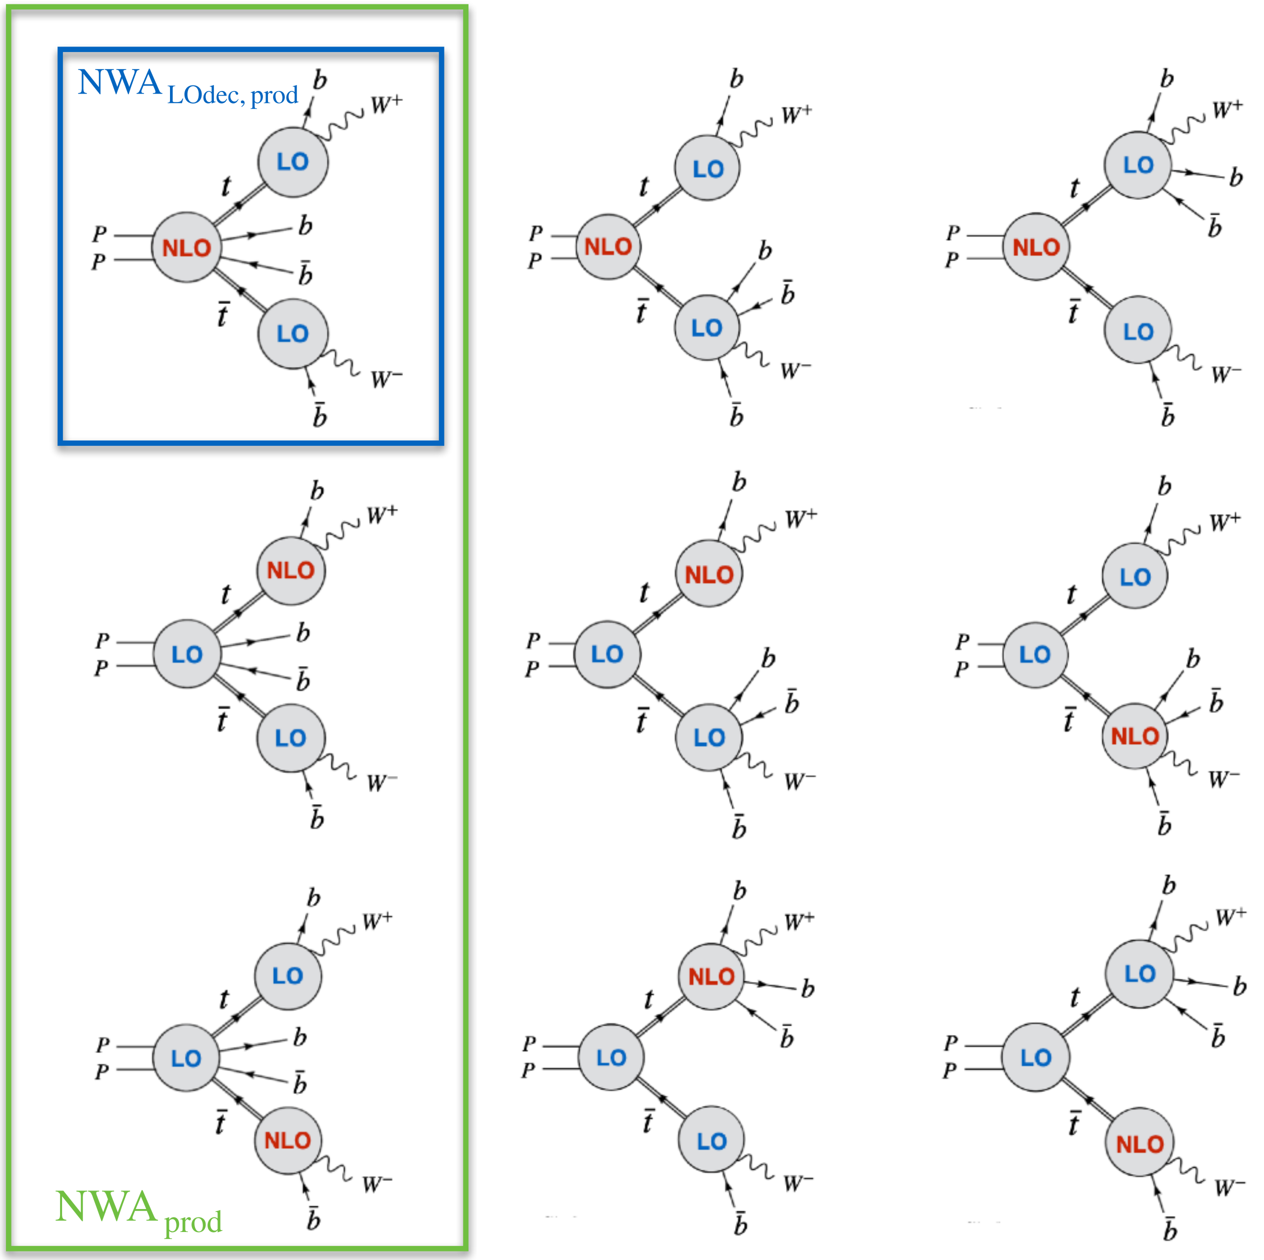
- *Full off-shell* vs NWA

Modelling	$\sigma^{\rm NLO}$ [fb]	$\delta_{\rm scale}$ [fb]	$\frac{\sigma^{\rm NLO}}{\sigma^{\rm NLO}_{\rm NWA_{full}}} - 1$
Off-shell	13.22(2)	$^{+2.65\ (20\%)}_{-2.96\ (22\%)}$	+0.5%
$\rm NWA_{full}$	13.16(1)	$^{+2.61\ (20\%)}_{-2.93\ (22\%)}$	–
$\rm NWA_{LOdec}$	13.22(1)	$^{+3.77\ (29\%)}_{-3.31\ (25\%)}$	+0.5%
$\rm NWA_{prod}$	13.01(1)	$^{+2.58\ (20\%)}_{-2.89\ (22\%)}$	−1.1%
$\rm NWA_{prod,\,exp}$	12.25(1)	$^{+2.87\ (23\%)}_{-2.86\ (23\%)}$	−6.9%
$\rm NWA_{prod,\,LOdec}$	13.11(1)	$^{+3.74\ (29\%)}_{-3.28\ (25\%)}$	−0.4%

- $\rm NWA_{prod,exp}$ vs $\rm NWA_{prod,LOdec}$:

↪ Genuine QCD corrections to top decays: $-7\,\%$

Accidental cancellations with $\mathcal{O}(\alpha_s^2)$ effects

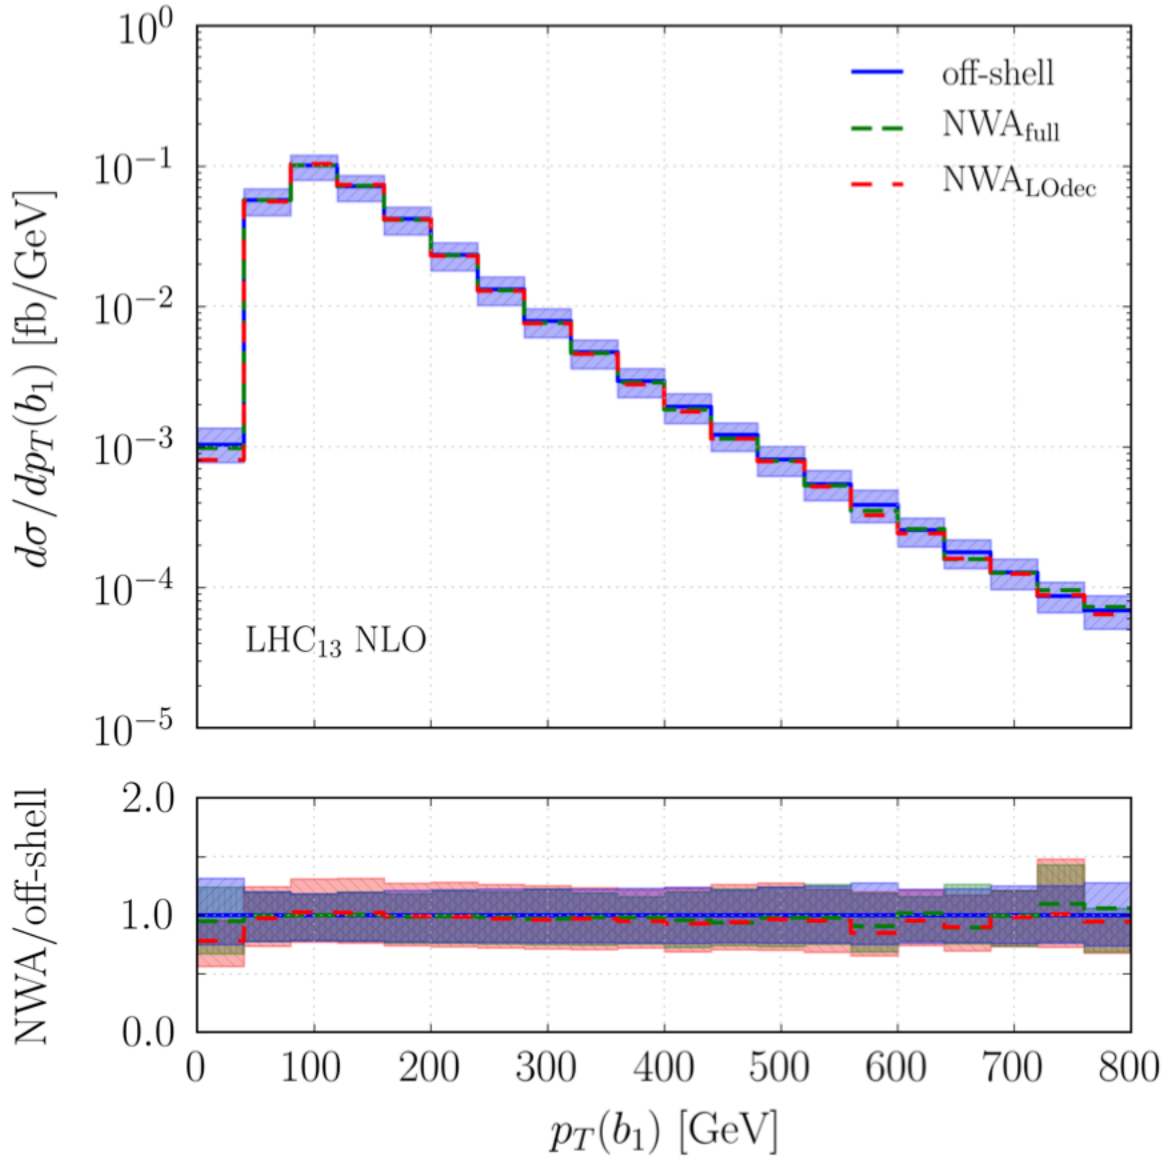


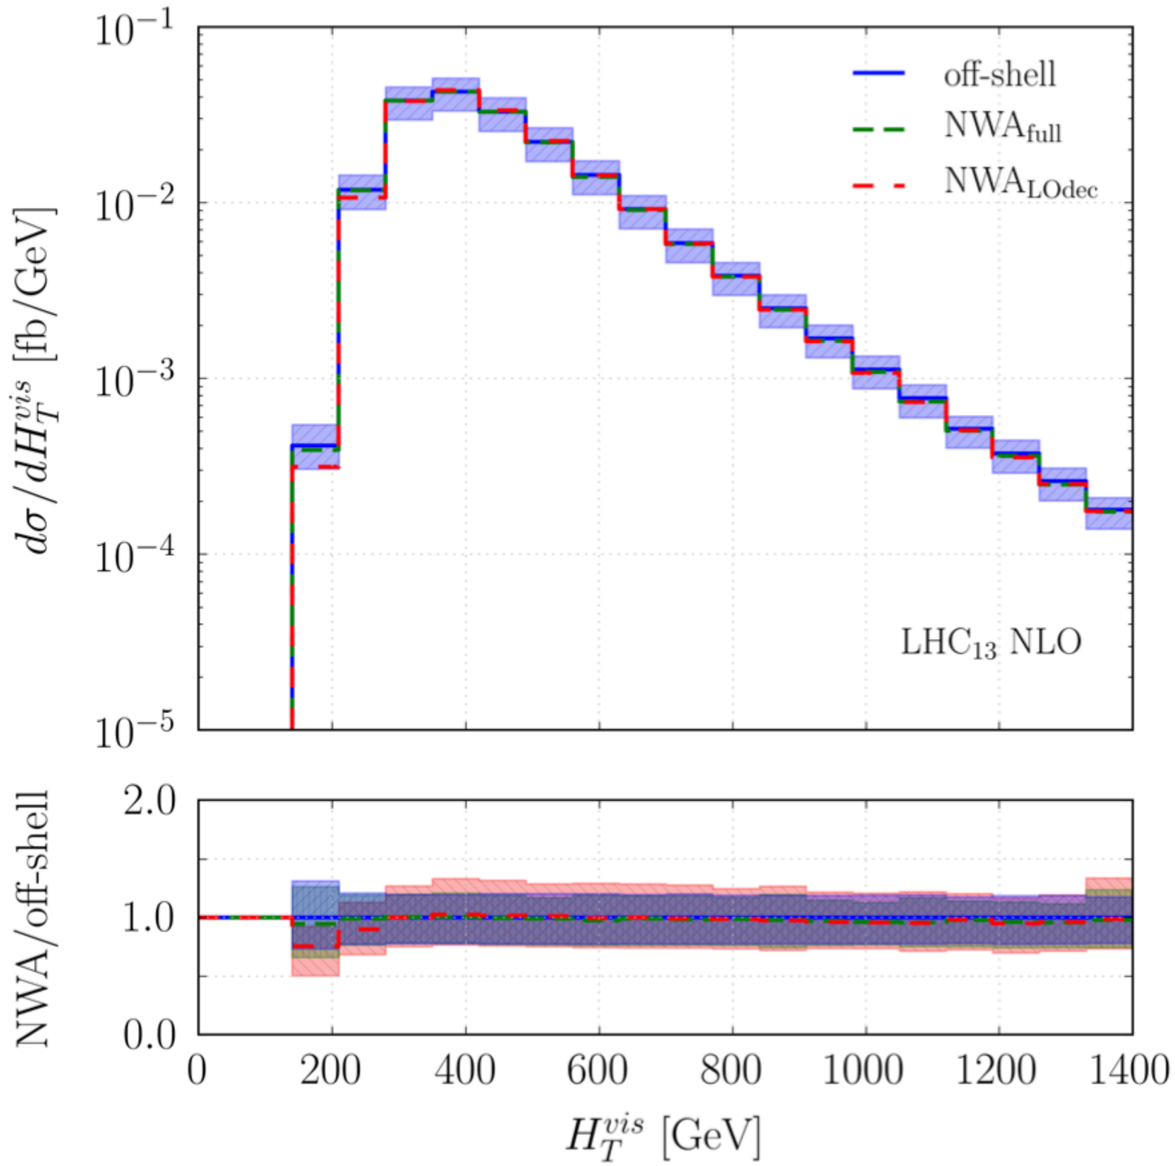
$t\bar{t}b\bar{b}$: impact of off-shell effects at differential level

[GB, Bi, Hartanto, Kraus, Lupattelli and Worek, Phys. Rev. D (107) 2023]

- Off-shell effects amount to few permille for most observables used in SM analyses

↪ Examples:



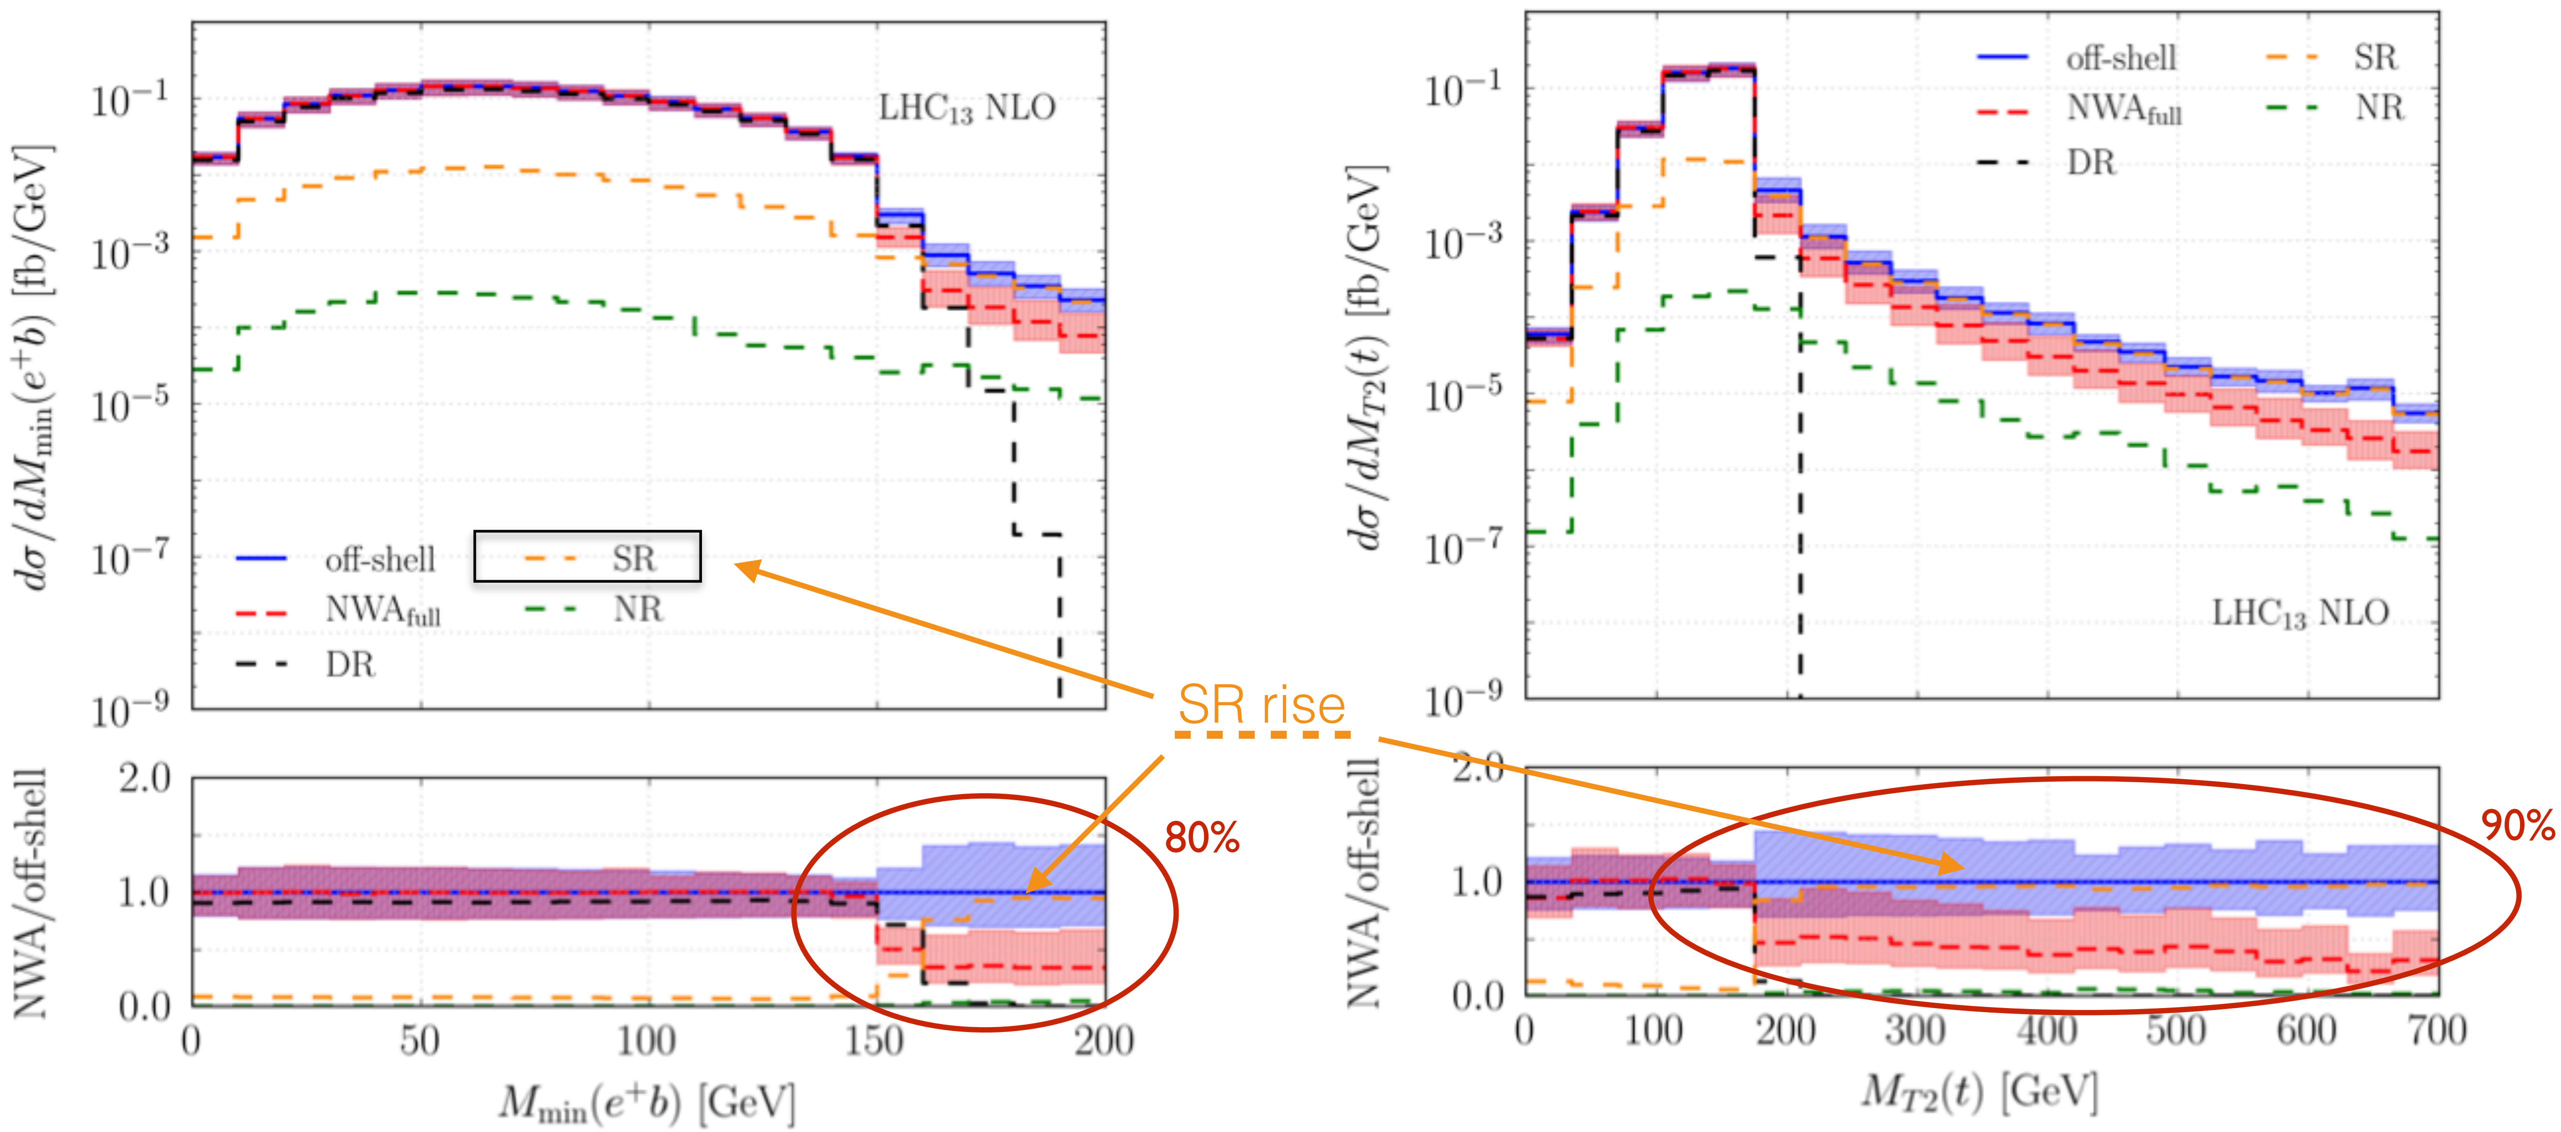


$$H_T^{vis} = \sum_{i=1}^{4} p_T(b_i) + p_T(e^+) + p_T(\mu^-)$$

$t\bar{t}b\bar{b}$: anatomy of full off-shell effects at differential level

[GB, Bi, Hartanto, Kraus, Lupattelli and Worek, Phys. Rev. D (107) 2023]

- **Threshold observables** (mainly used in BSM studies) are more sensitive:



$$\mathrm{LO_{NWA}} \rightarrow \; M_{min}(e^+b) < \sqrt{m_t^2 - m_W^2} \approx 153 \text{ GeV}$$

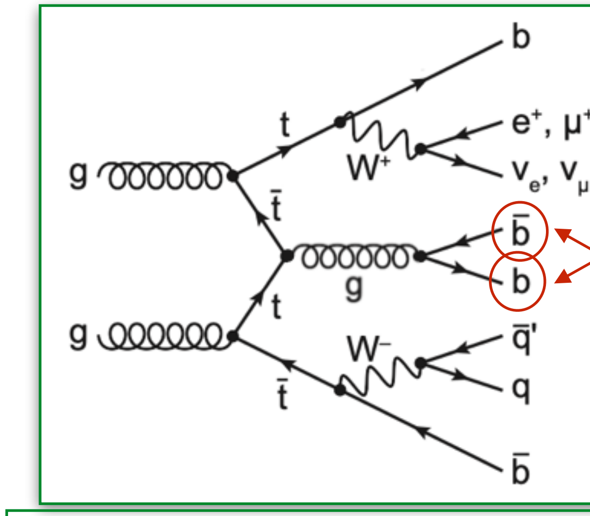
$$M_{T2}(t) = \min_{\sum p_T^{\nu_i} = p_T^{miss}} \left[\max\{M_T^2(p_T(e^+X_t), p_T(\nu_1)), M_T^2(p_T(\mu^-X_{\bar{t}}), p_T(\nu_2))\}\right]$$

$t\bar{t}b\bar{b}$: prompt b-jet identification

- Labelling prompt b-jets in $t\bar{t}b\bar{b}$ is not free of ambiguities in a full calculation (due to combinatorial background and quantum interference)

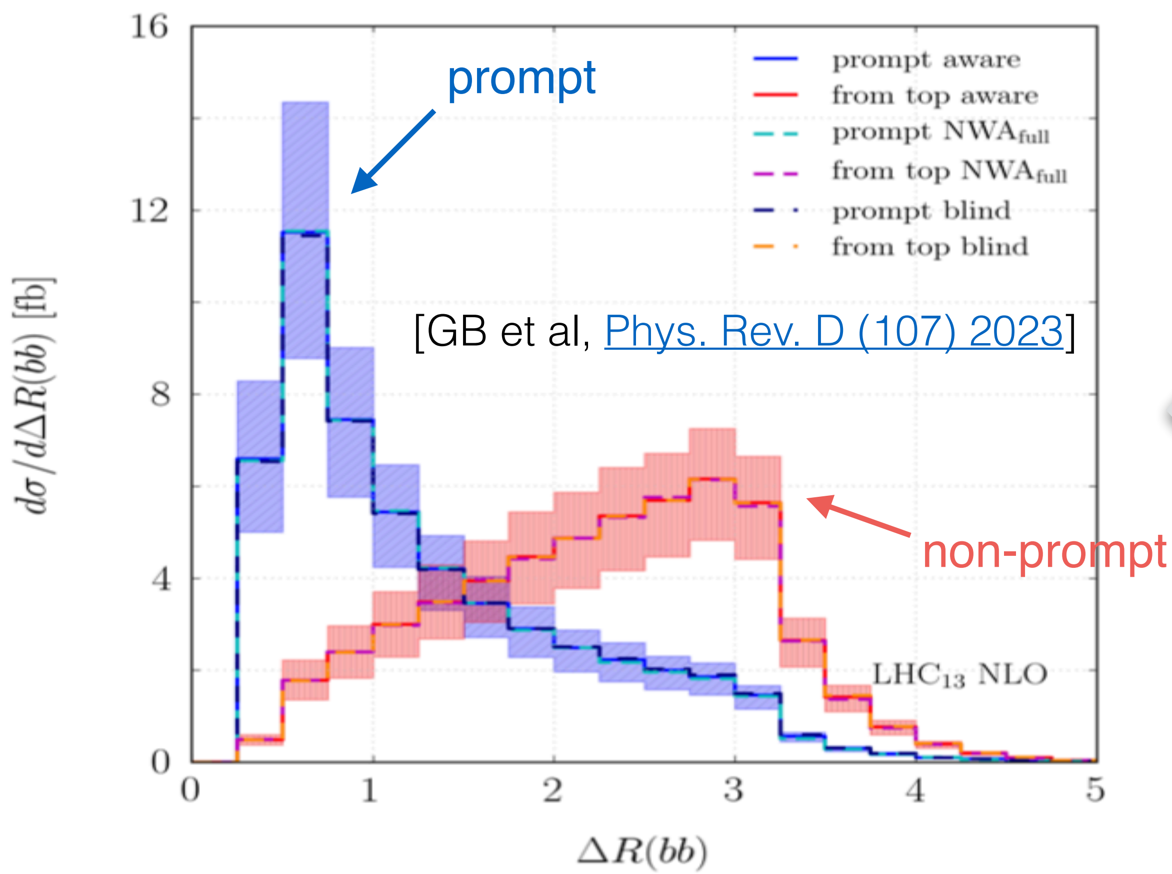
- Kinematic-based prescription: determine prompt b-jets according to a minimum principle for Q:

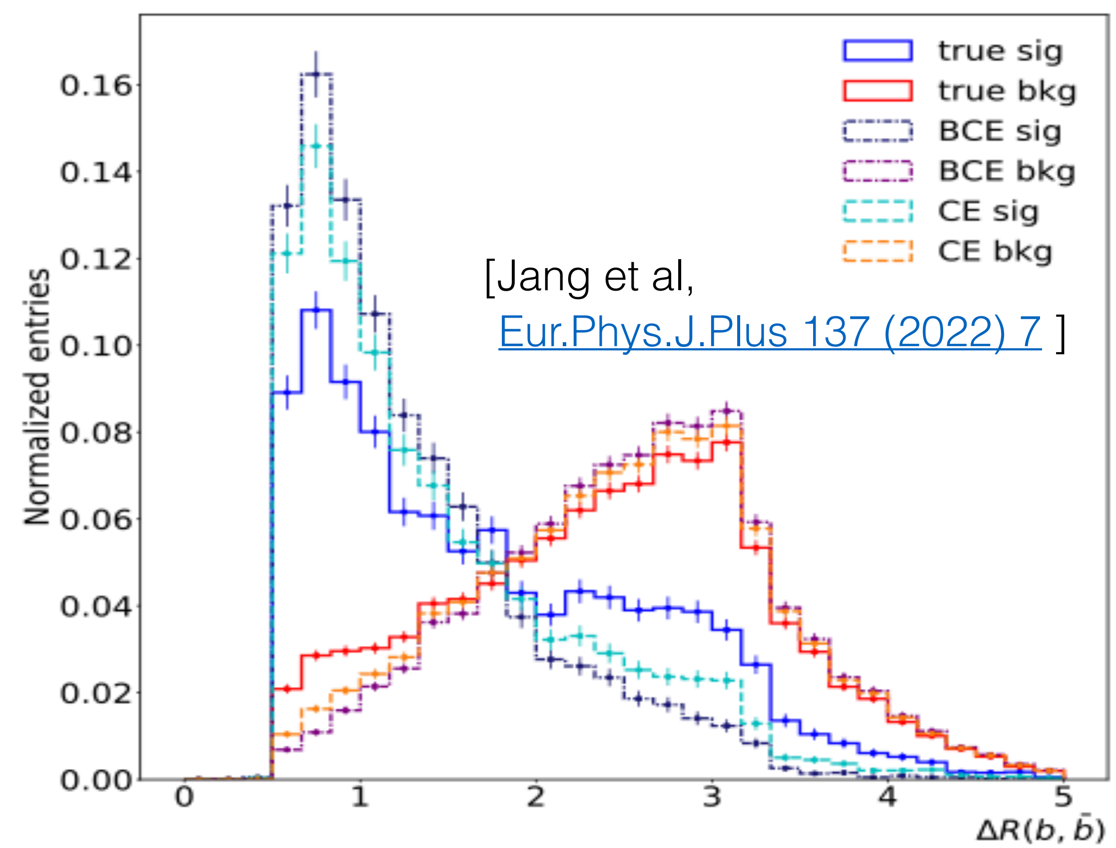
$$Q = |M(t) - m_t| \times |M(\bar{t}) - m_t| \times |M^{\text{prompt}}(bb)|$$



$t \to W^+ b \quad \bar{t} \to W^- \bar{b} \quad g \to b\bar{b}$

- Results consistent with DNN-based studies:





Conclusions

- We have examined some recent developments concerning matrix element description of $t\bar{t}b\bar{b}$ and $t\bar{t}jj$ @ NLO QCD

$t\bar{t}jj$ dilepton

- Jet radiation included in production and decays
- "*Mix*" contribution impacts NLO normalisation

$$\boxed{\Delta R(jb) > 0.8} \quad \rightarrow \quad \sigma_{\rm NLO} = 1462\,({\rm Prod}) - 236\,({\rm Mix}) + 0.2\,({\rm Dec}) = 1225 \ {\rm fb}$$

-19% of $\sigma_{\rm NLO}$

$$\boxed{\Delta R(jb) > 0.4} \quad \rightarrow \quad \sigma_{\rm NLO} = 1662\,({\rm Prod}) - 205\,({\rm Mix}) + 2.4\,({\rm Dec}) = 1460 \ {\rm fb}$$

-14% of $\sigma_{\rm NLO}$

$t\bar{t}b\bar{b}$ dilepton

- Off-shell effects small for most distributions used in SM analyses: $\mathcal{O}(0.5\%)$
- Impact of QCD corrections to top quark decays: $-7\,\%$
- Impact of $\mathcal{O}(\alpha_s^2)$ effects in $\sigma^{\rm NLO}_{\rm NWA}$ and $\sigma^{\rm NLO}_{\rm off-shell}$: $6\,\%$ (within the scale uncertainties)

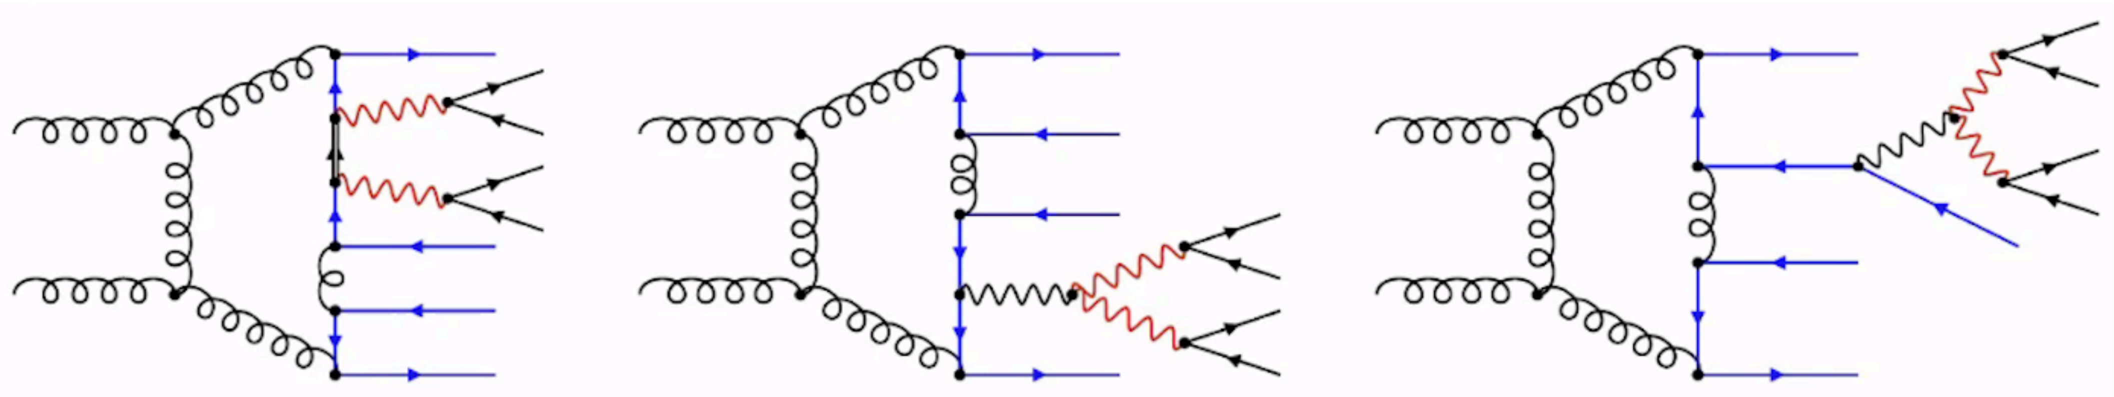
Technical aspects of off-shell $t\bar{t}b\bar{b}$ at NLO

Full off-shell calculations for multi-leg processes can be very challenging

One-loop correction type	Number of Feynman diagrams
Self-energy	93452
Vertex	88164
Box-type	49000
Pentagon-type	25876
Hexagon-type	11372
Heptagon-type	3328
Octagon-type	336
Total number [gg channel]	271528

Example: $gg \to e^+\nu_e \mu^- \bar{\nu}_\mu b\bar{b}\, b\bar{b}$

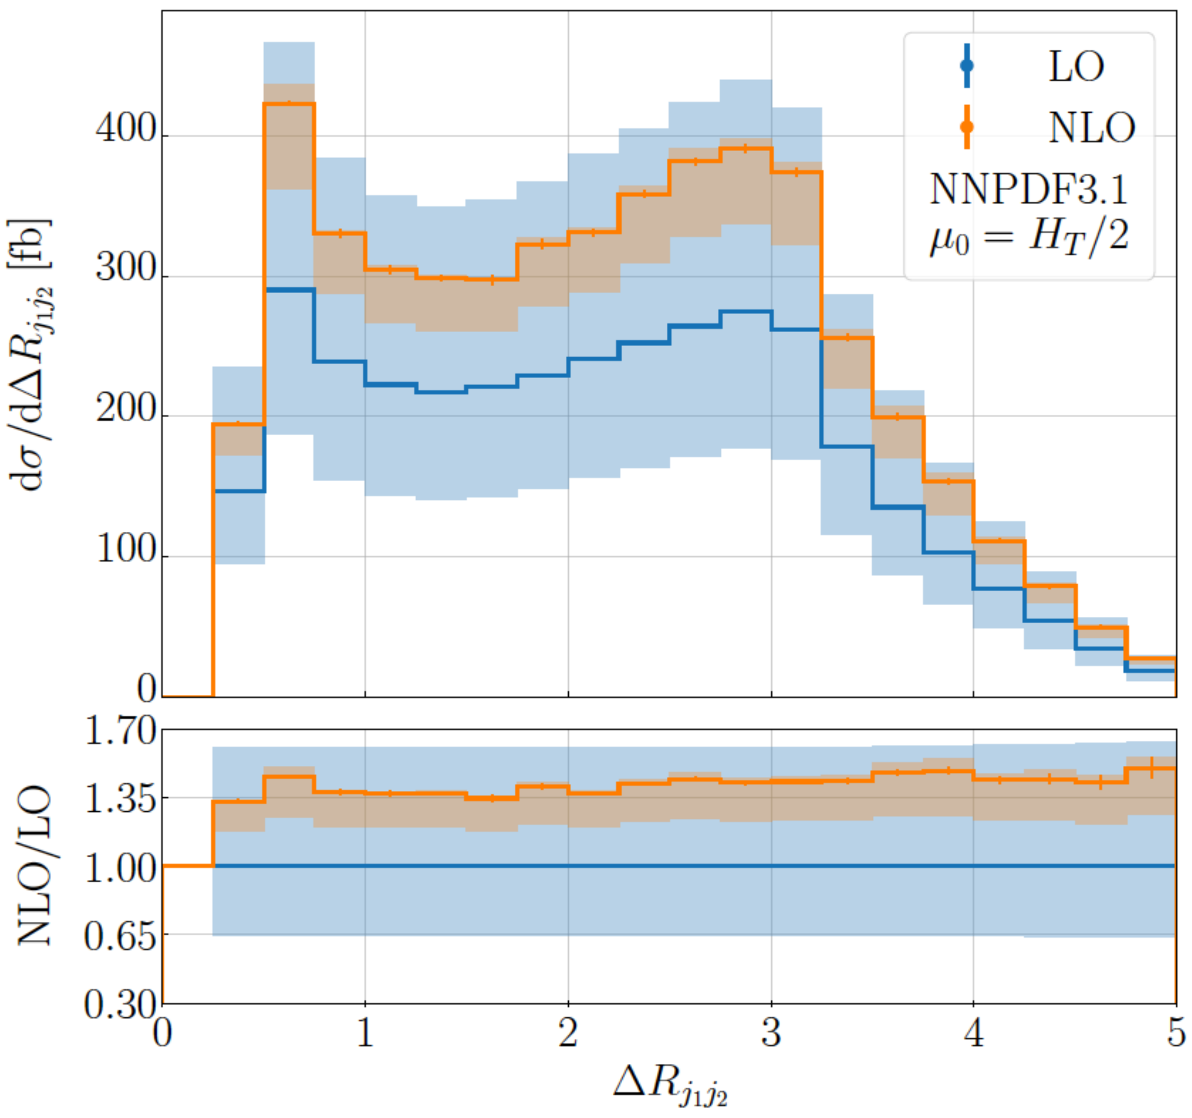
Partonic Subprocess	Number of Feynman diagrams	Number of CS Dipoles	Number of NS Subtractions
$gg \to e^+\nu_e \mu^-\bar{\nu}_\mu b\bar{b}\, b\bar{b}\, g$	41364	90	18
$q\bar{q} \to e^+\nu_e \mu^-\bar{\nu}_\mu b\bar{b}\, b\bar{b}\, g$	9576	50	10
$gq \to e^+\nu_e \mu^-\bar{\nu}_\mu b\bar{b}\, b\bar{b}\, q$	9576	50	10
$g\bar{q} \to e^+\nu_e \mu^-\bar{\nu}_\mu b\bar{b}\, b\bar{b}\, \bar{q}$	9576	50	10

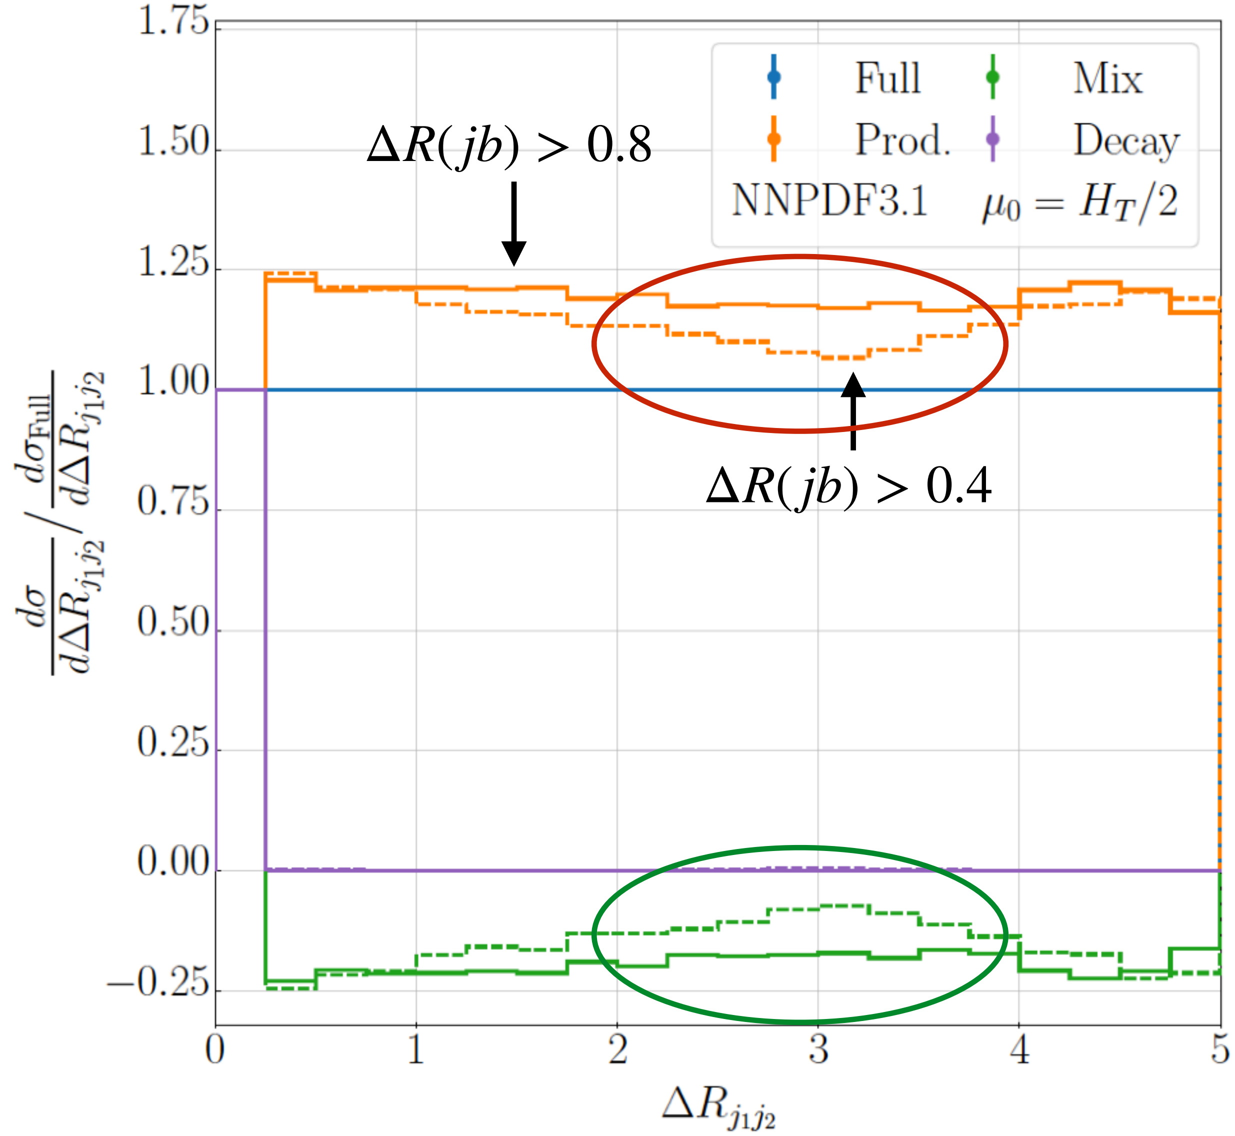


$t\bar{t}jj$: differential cross sections

$\Delta R_{j_1 j_2}$

[GB, Lupattelli, Stremmer and Worek, Phys. Rev. D (107) 2023, 114027]





- Sensitivity to $\Delta R(jb)$ cuts enhanced around $\Delta R(j_1 j_2) = 3$

$t\bar{t}$ + jets: cross section ratios

[GB, Lupattelli, Stremmer and Worek, Phys. Rev. D (107) 2023, 114027]

Fiducial cross section ratios

$\Delta R(jb) > 0.8$

$\mathcal{R}_n$	$\mathcal{R}^{\rm LO}$	$\mathcal{R}^{\rm NLO}$	$\mathcal{R}^{\rm NLO}_{\rm exp}$
$\mathcal{R}_1 = \sigma_{t\bar{t}j}/\sigma_{t\bar{t}}$	$0.3686^{+12\%}_{-10\%}$	$0.3546^{+0\%}_{-5\%}$	$0.3522^{+0\%}_{-3\%}$
$\mathcal{R}_2 = \sigma_{t\bar{t}jj}/\sigma_{t\bar{t}j}$	$0.2539^{+11\%}_{-9\%}$	$0.2660^{+0\%}_{-5\%}$	$0.2675^{+0\%}_{-2\%}$

$$\mathcal{R}^{\rm NLO}_{\rm exp} = \frac{\sigma^0_{t\bar{t}j(j)}}{\sigma^0_{t\bar{t}(j)}}\left(1 + \frac{\sigma^1_{t\bar{t}j(j)}}{\sigma^0_{t\bar{t}j(j)}} - \frac{\sigma^1_{t\bar{t}(j)}}{\sigma^0_{t\bar{t}(j)}}\right)$$

- NLO QCD corrections: $\mathscr{R}_1 \to -4\,\%$ $\mathscr{R}_2 \to +4\,\%$
- NLO uncertainties: Scale $\to$ $\mathcal{O}(5\%)$ PDF $\to$ $\mathcal{O}(0.5\%)$

$t\bar{t}b\bar{b}$ with dilepton signatures: full off-shell predictions

- **Integrated fiducial cross sections**

$\sqrt{s} = 13$ TeV

Analysis cuts: $p_T(\ell) > 20$ GeV , $p_T(b) > 25$ GeV , $|y(\ell)| < 2.5$, $|y(b)| < 2.5$

[GB, Bi, Hartanto, Kraus, Lupattelli and Worek, JHEP 08 (2021) 008]

$p_T(b)$	$\sigma^{\rm LO}$ [fb]	$\delta_{\rm scale}$	$\sigma^{\rm NLO}$ [fb]	$\delta_{\rm scale}$	$\delta_{\rm PDF}$	$\mathcal{K} = \sigma^{\rm NLO}/\sigma^{\rm LO}$
			$\mu_R = \mu_F = \mu_0 = H_T/3$		[NNPDF 3.1]

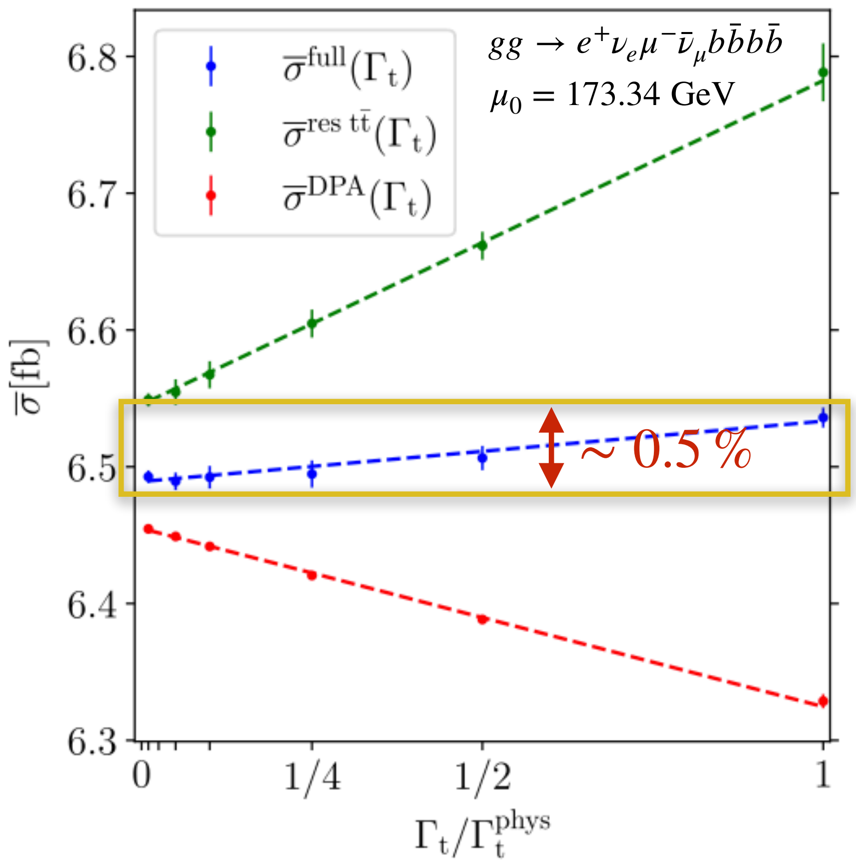
[Denner, Lang, Pellen, Phys. Rev. D 104 (2021), 056018]



QCD corrections are large: $\mathcal{O}(80\%)$

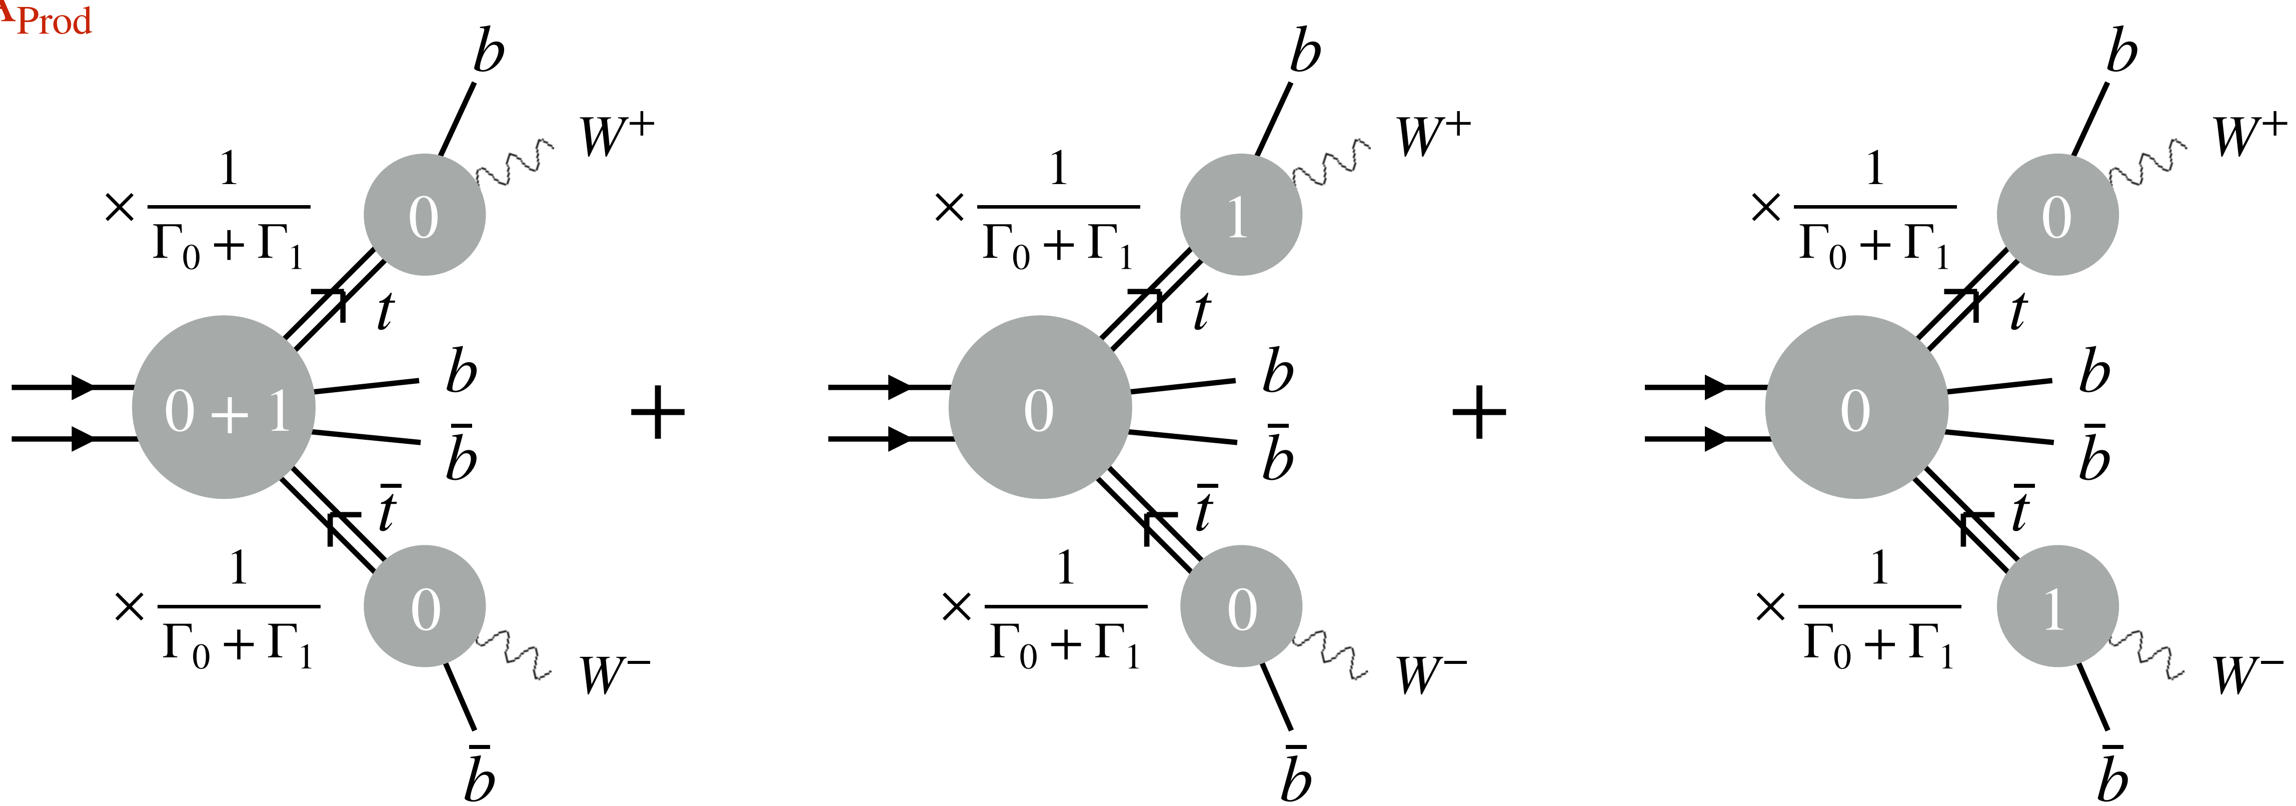
Effects of Γ_t expansion in NWA

- "Unexpanded" cross section in NWA:

$$\Gamma_t^{NLO} = \Gamma_0 + \Gamma_1$$

$\Gamma_0 \to \mathcal{O}(\alpha_s^0)$, $\Gamma_1 \to \mathcal{O}(\alpha_s)$

$$d\sigma^{NLO}_{\mathrm{NWA_{Prod}}} \equiv$$



- $d\sigma^{NLO}_{\mathrm{NWA_{Prod}}}$ yields the same Γ_t^{NLO} factors that are present in the full off-shell calculation
- Most suitable setup to assess the impact of genuine off-shell effects

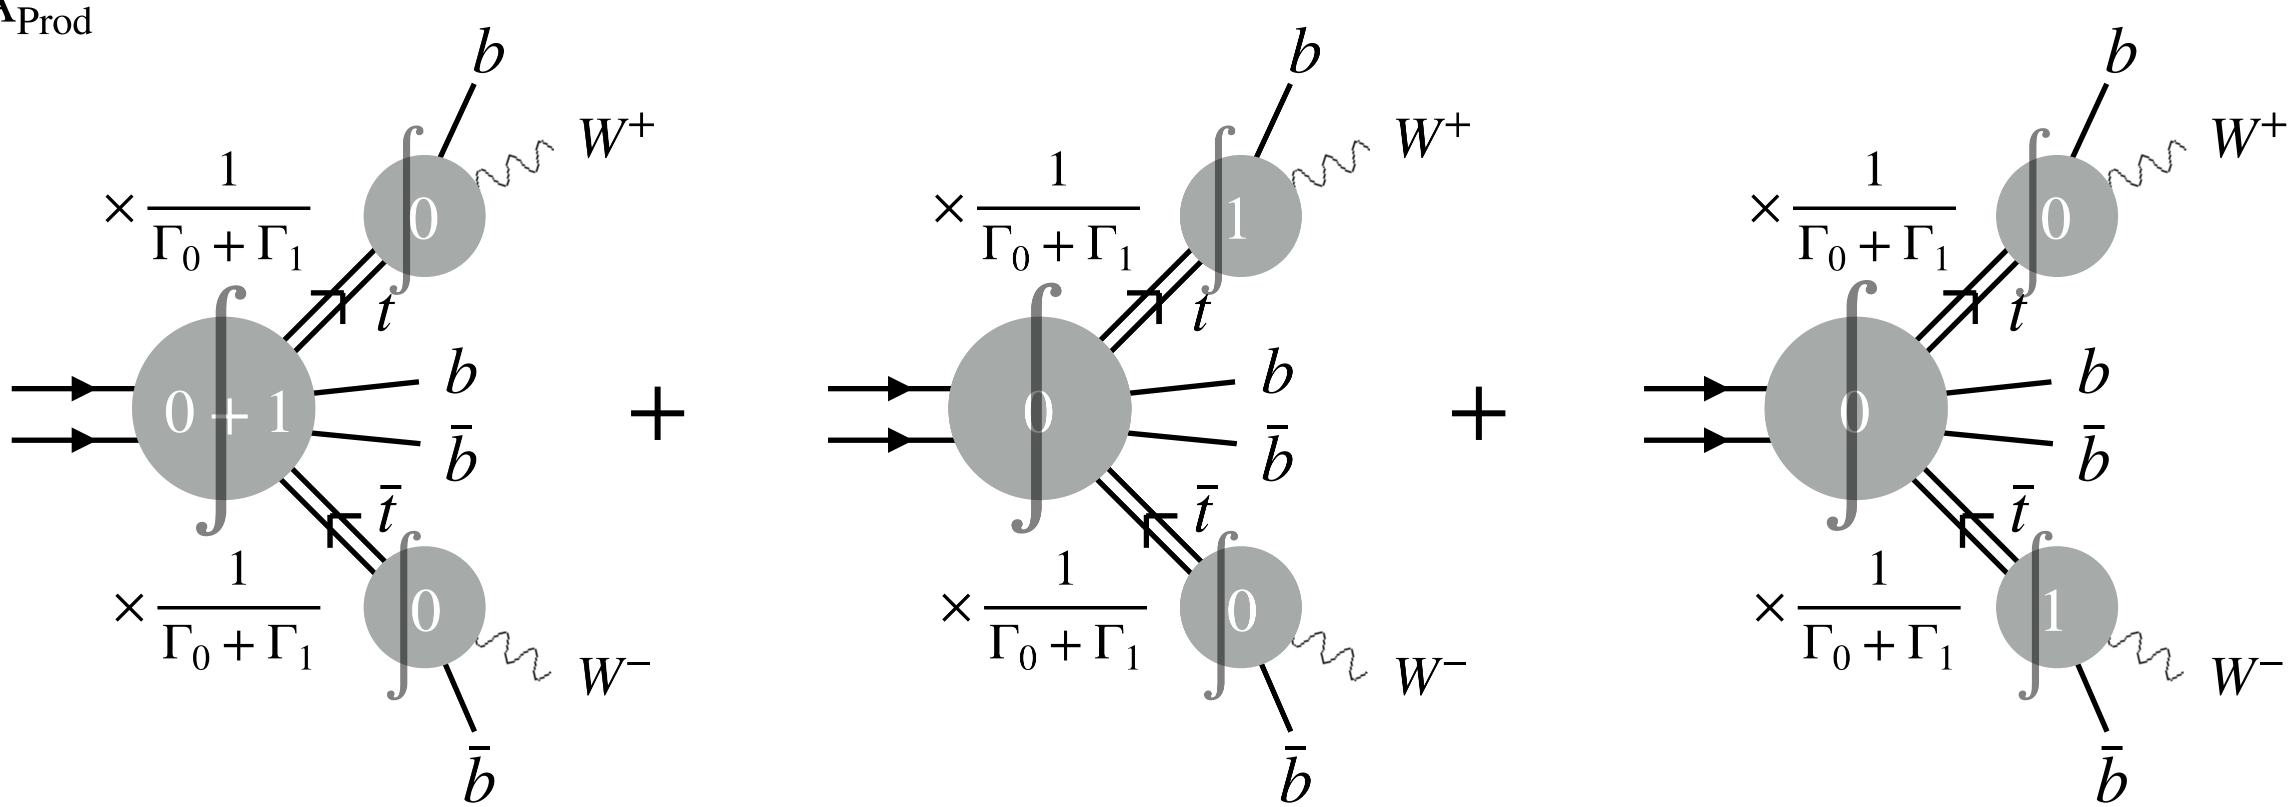
Effects of Γ_t expansion in NWA

- "Unexpanded" cross section in NWA:

$$\Gamma_t^{NLO} = \Gamma_0 + \Gamma_1$$

$\Gamma_0 \rightarrow \mathcal{O}(\alpha_s^0)$, $\Gamma_1 \rightarrow \mathcal{O}(\alpha_s)$

$$\int d\sigma^{NLO}_{\text{NWA}_{\text{Prod}}} =$$



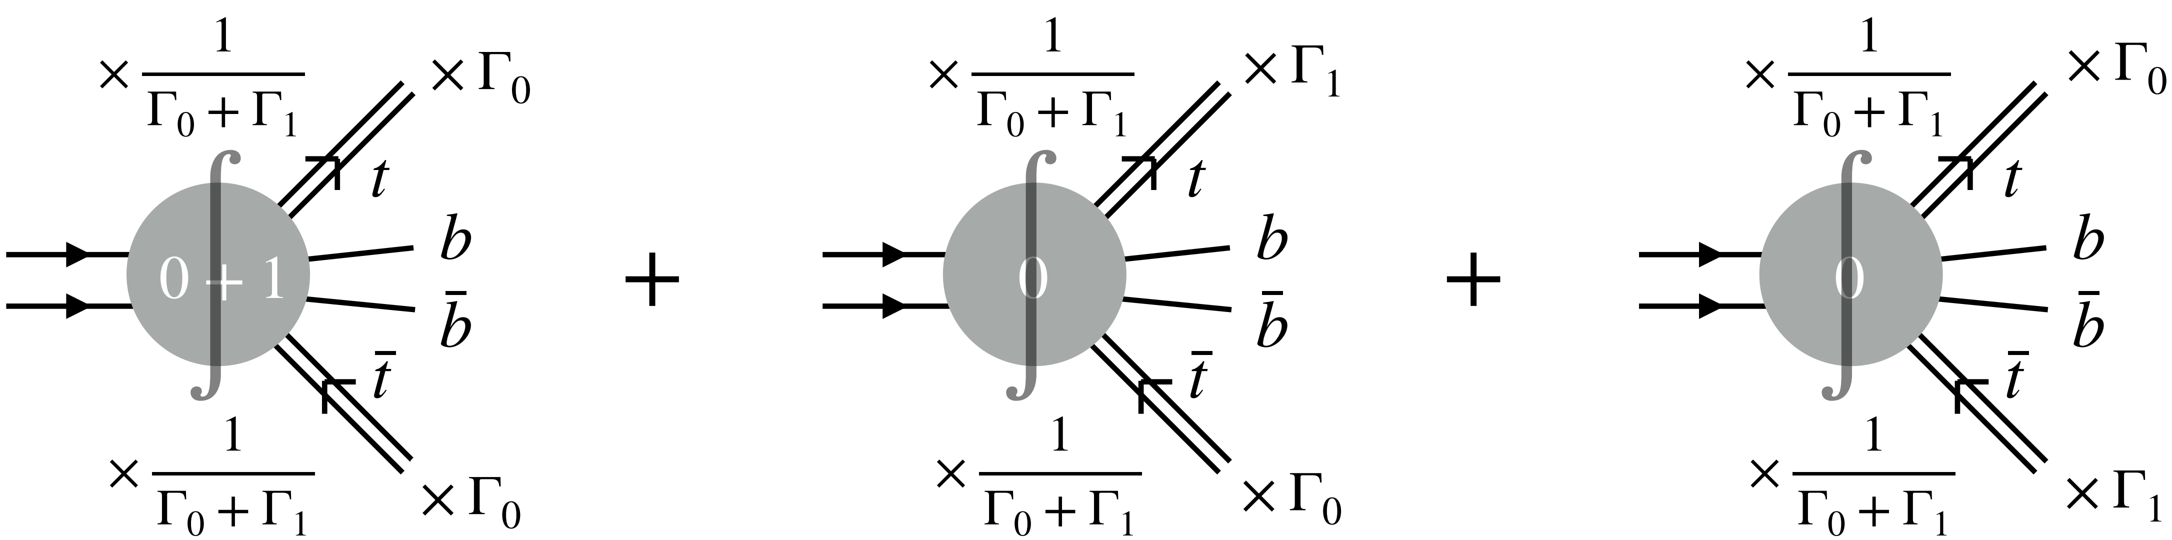
Effects of Γ_t expansion in NWA

- "Unexpanded" cross section in NWA:

$$\Gamma_t^{NLO} = \Gamma_0 + \Gamma_1$$

Γ_0: $\mathcal{O}(\alpha_s^0)$ $\quad$ Γ_1: $\mathcal{O}(\alpha_s)$

$$\int d\sigma^{NLO}_{\mathrm{NWA}_{\mathrm{Prod}}} =$$

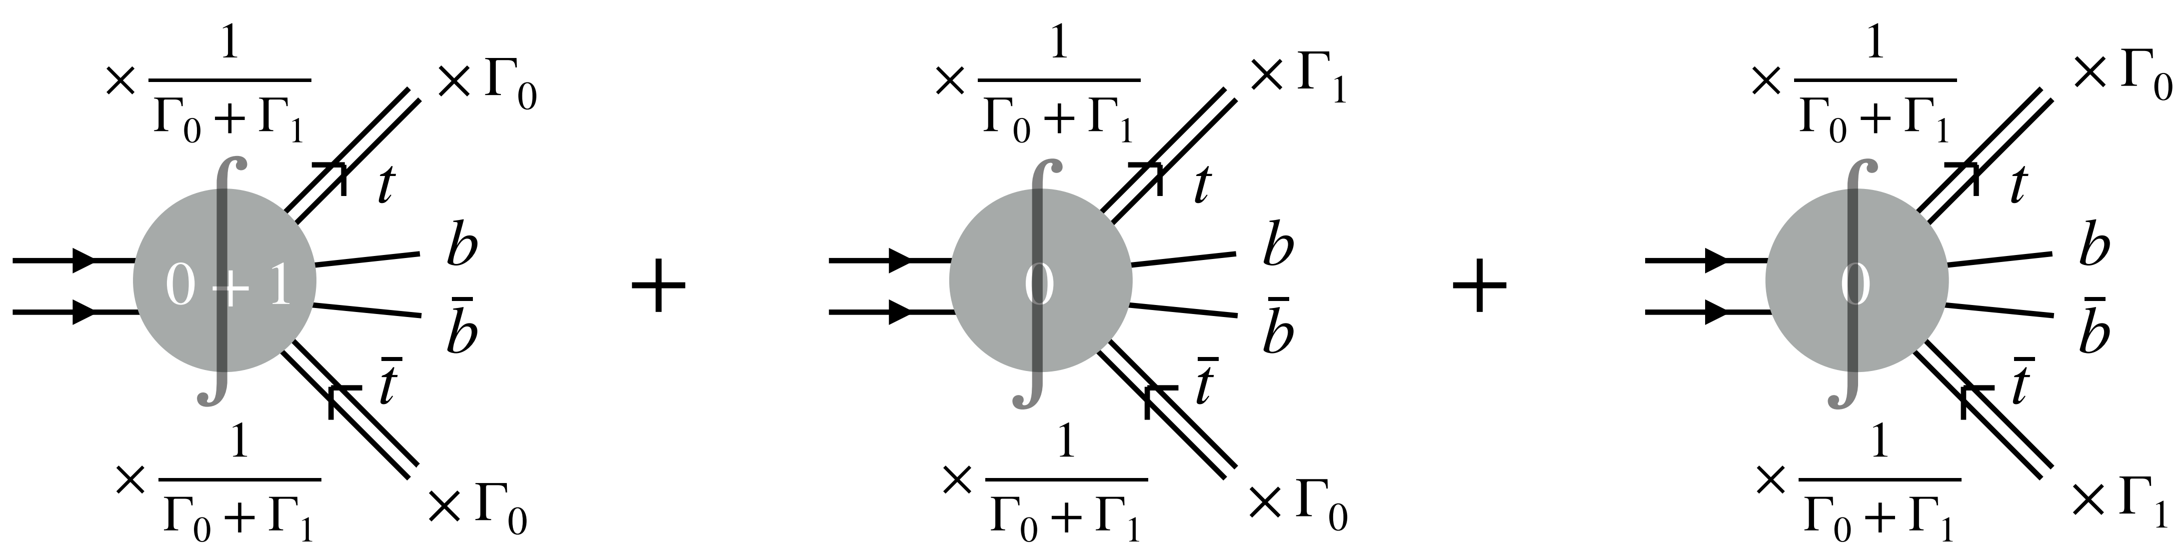


- "Unexpanded" cross section in NWA:

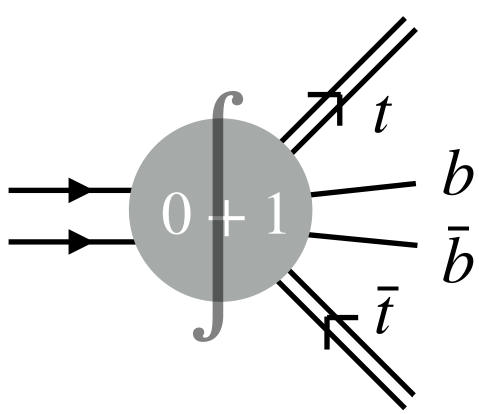
$$\Gamma_t^{NLO} = \Gamma_0 + \Gamma_1$$

$\Gamma_0 \rightarrow \mathcal{O}(\alpha_s^0)$, $\Gamma_1 \rightarrow \mathcal{O}(\alpha_s)$

$$\int d\sigma^{NLO}_{\mathrm{NWA}_{\mathrm{Prod}}} =$$



$=$



$$+ \ \mathcal{O}(\alpha_s^2) \ = \ \sigma^{NLO}_{t\bar{t}b\bar{b},\,incl.} + \ \mathcal{O}(\alpha_s^2)$$

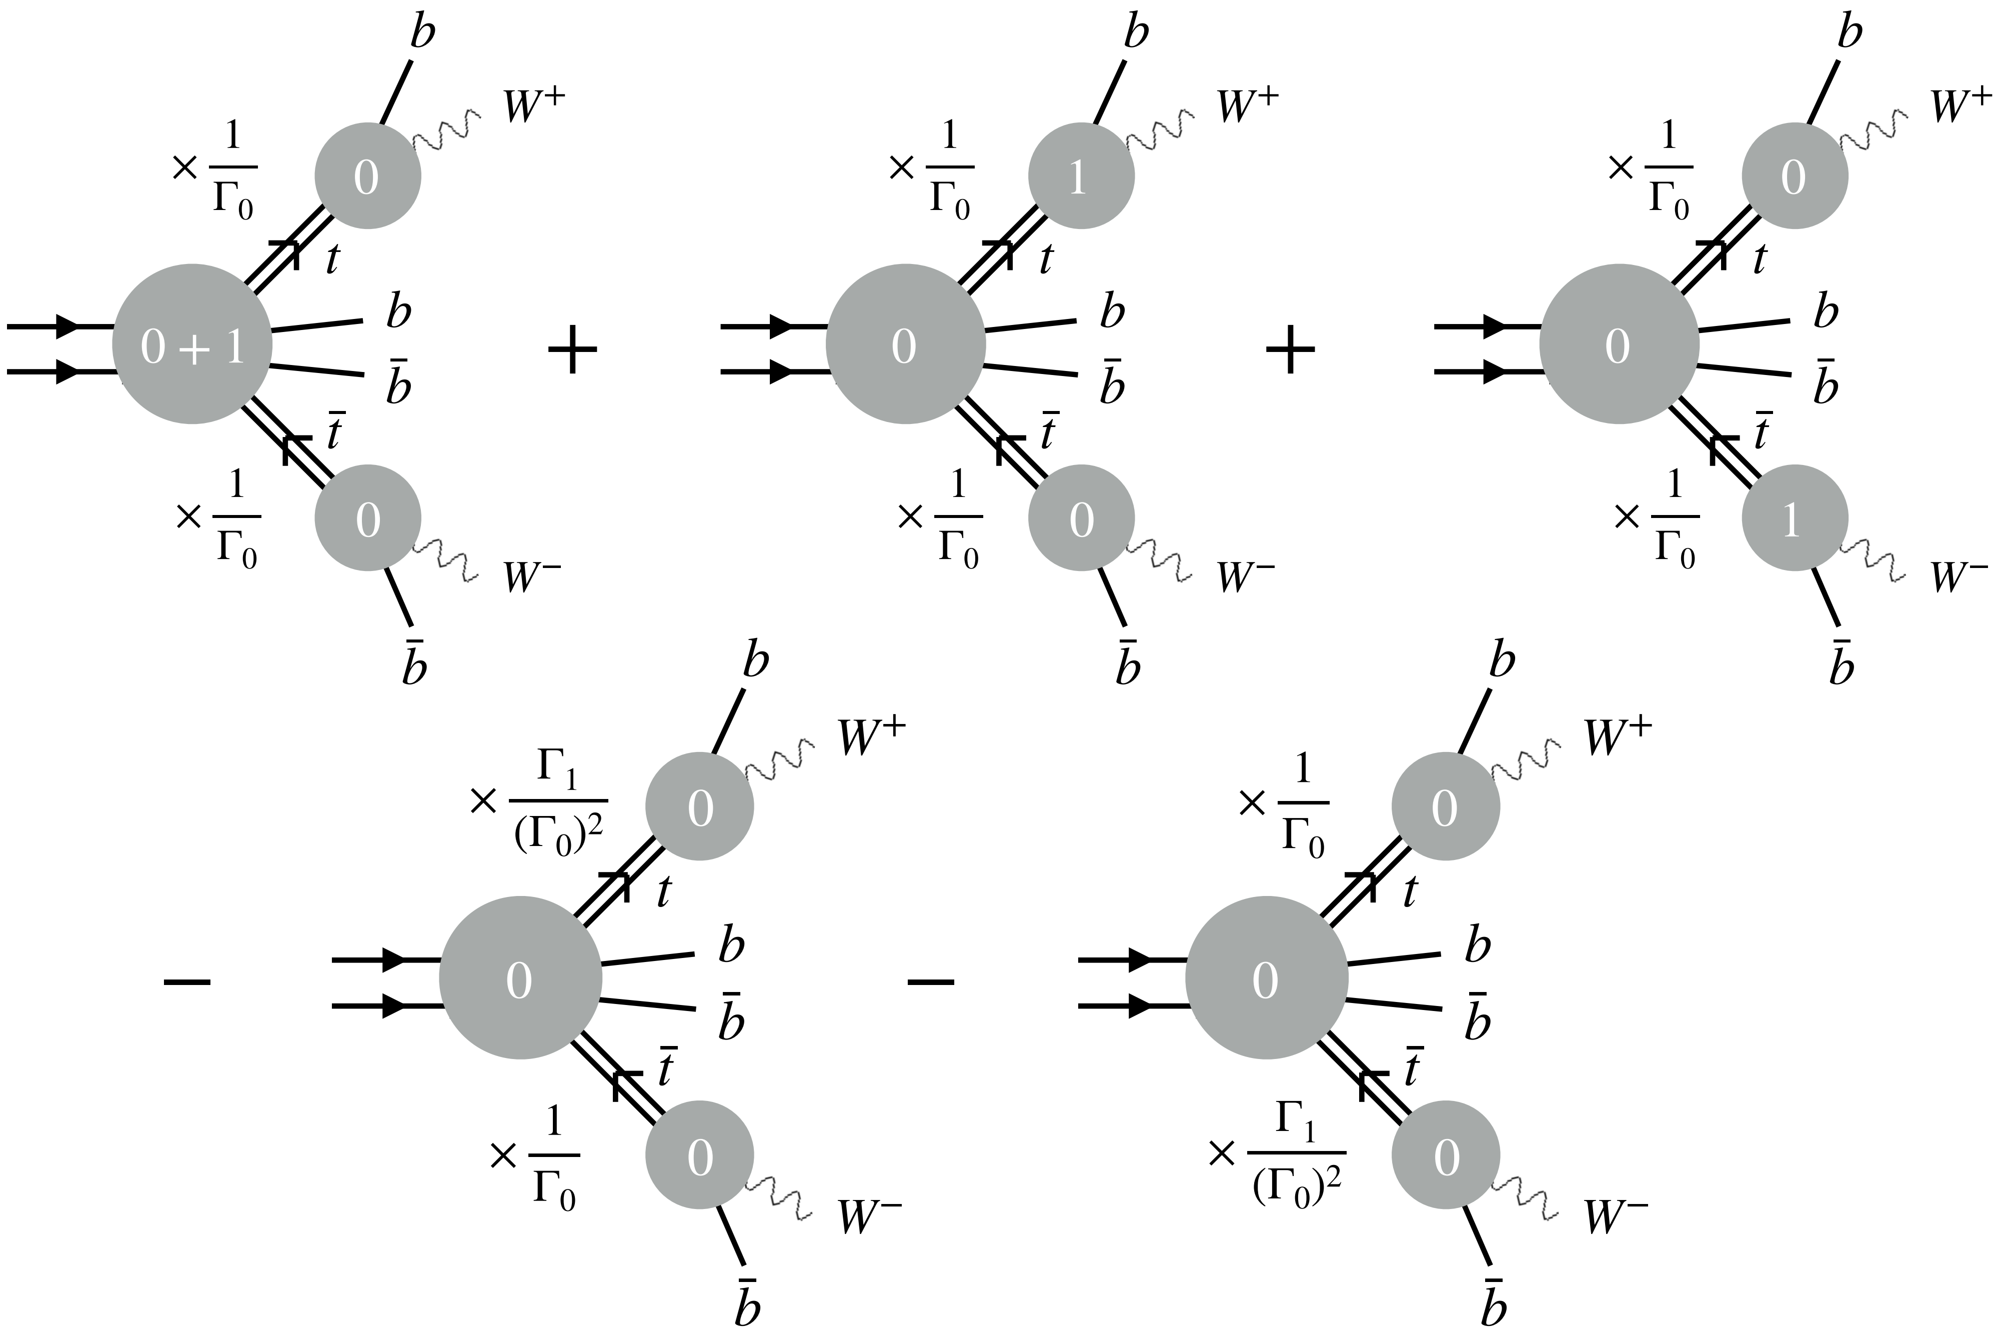
- Rigorous factorization at NLO spoiled by *formally suppressed $\mathcal{O}(\alpha_s^2)$ terms*.

Effects of Γ_t expansion in NWA

- "Expanded" cross section in NWA:

$$\frac{1}{\Gamma_0 + \Gamma_1} \sim \frac{1}{\Gamma_0} - \frac{\Gamma_1}{(\Gamma_0)^2} + \mathcal{O}(\alpha_s^2)$$

$$d\sigma^{NLO}_{\mathrm{NWA}_{\mathrm{Prod,\,exp}}} \equiv$$

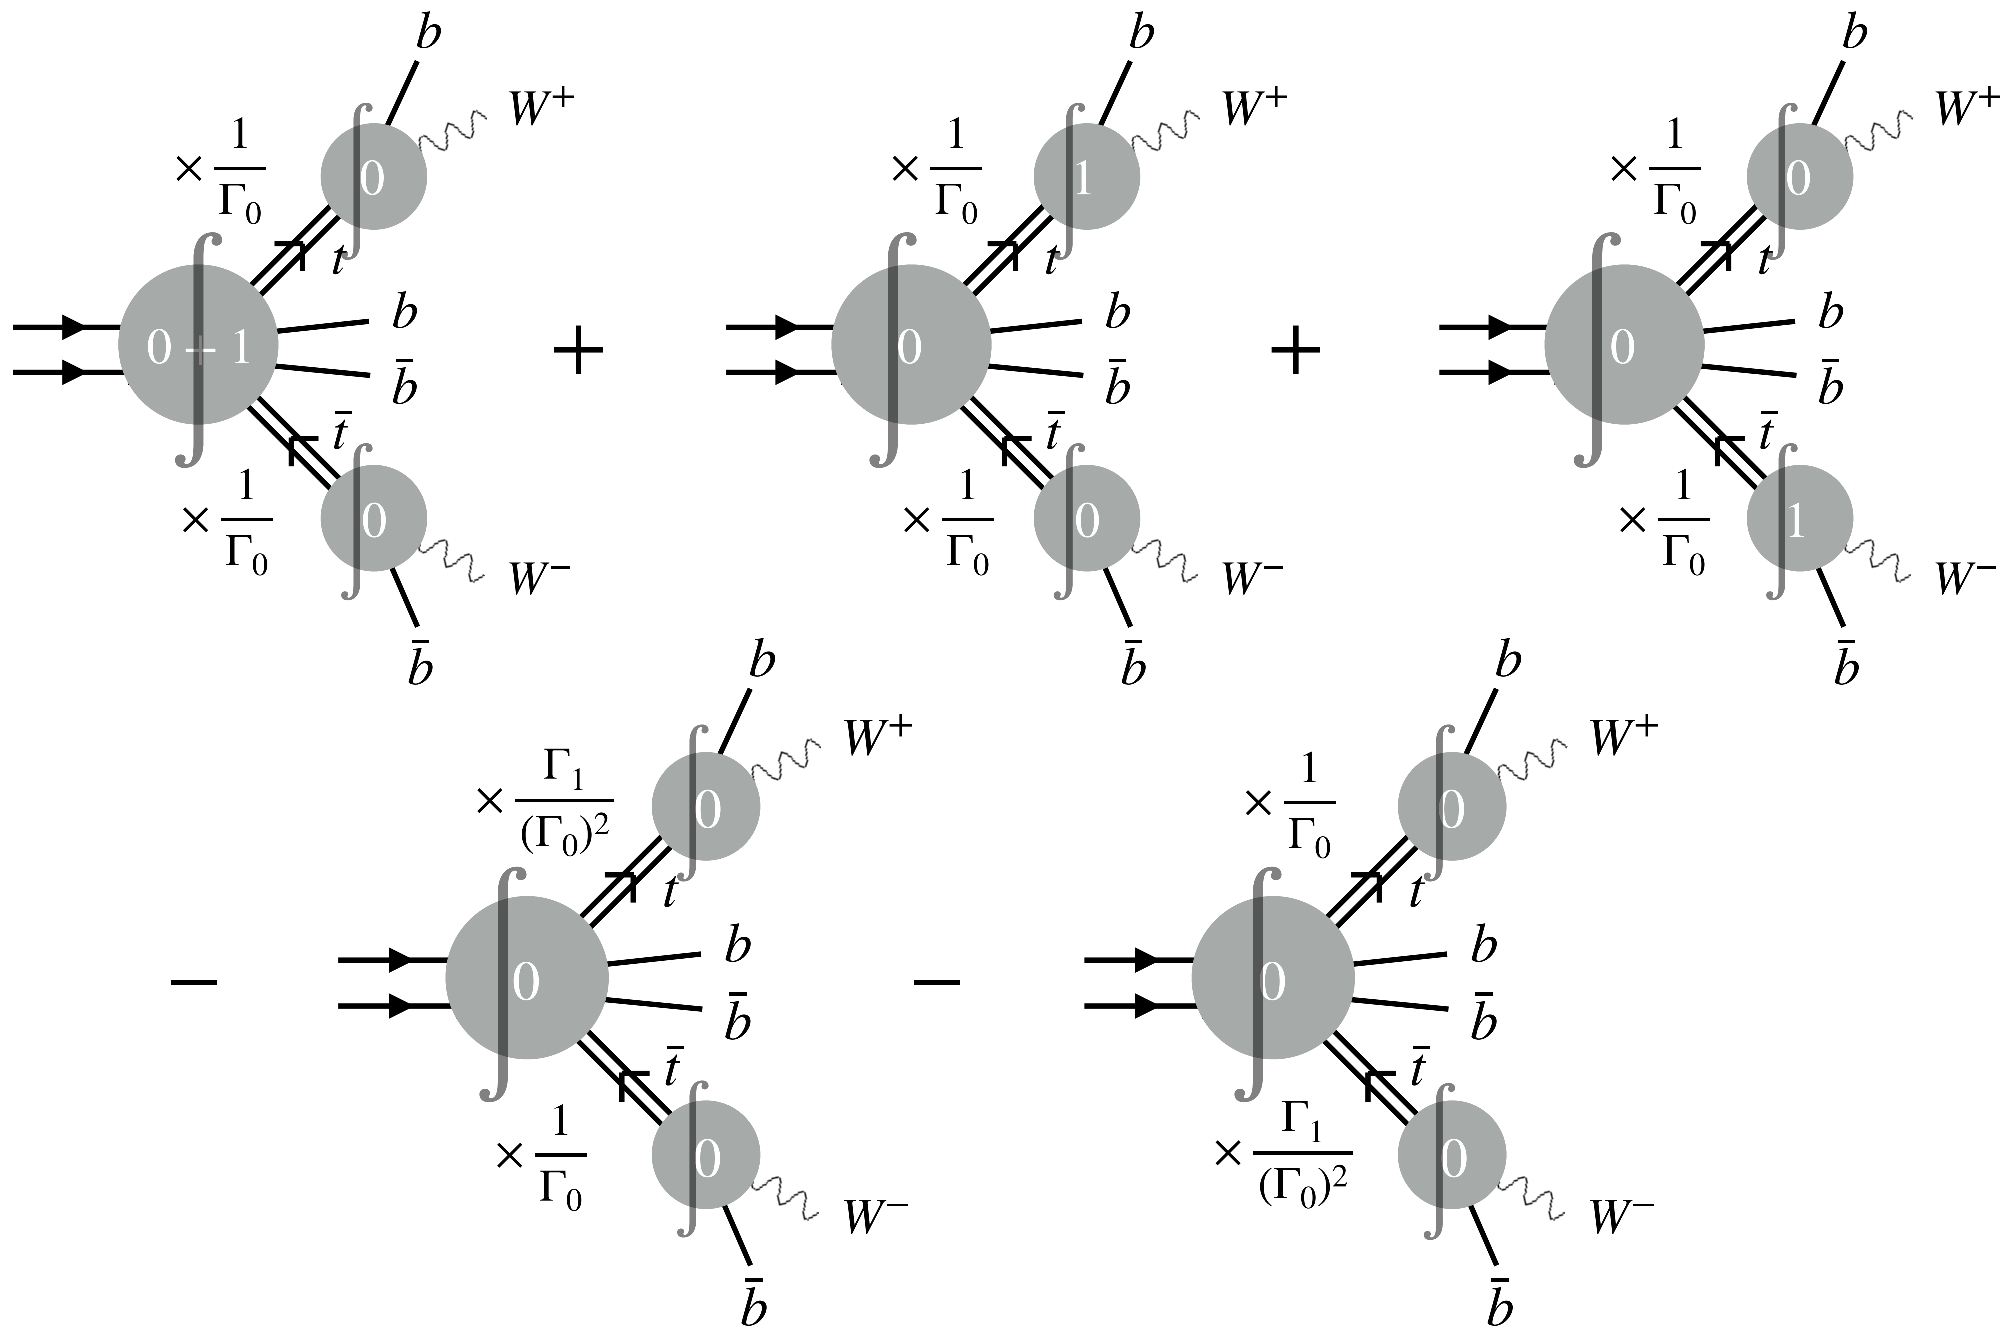


Effects of Γ_t expansion in NWA

- "Expanded" cross section in NWA:

$$\frac{1}{\Gamma_0 + \Gamma_1} \sim \frac{1}{\Gamma_0} - \frac{\Gamma_1}{(\Gamma_0)^2} + \mathcal{O}(\alpha_s^2)$$

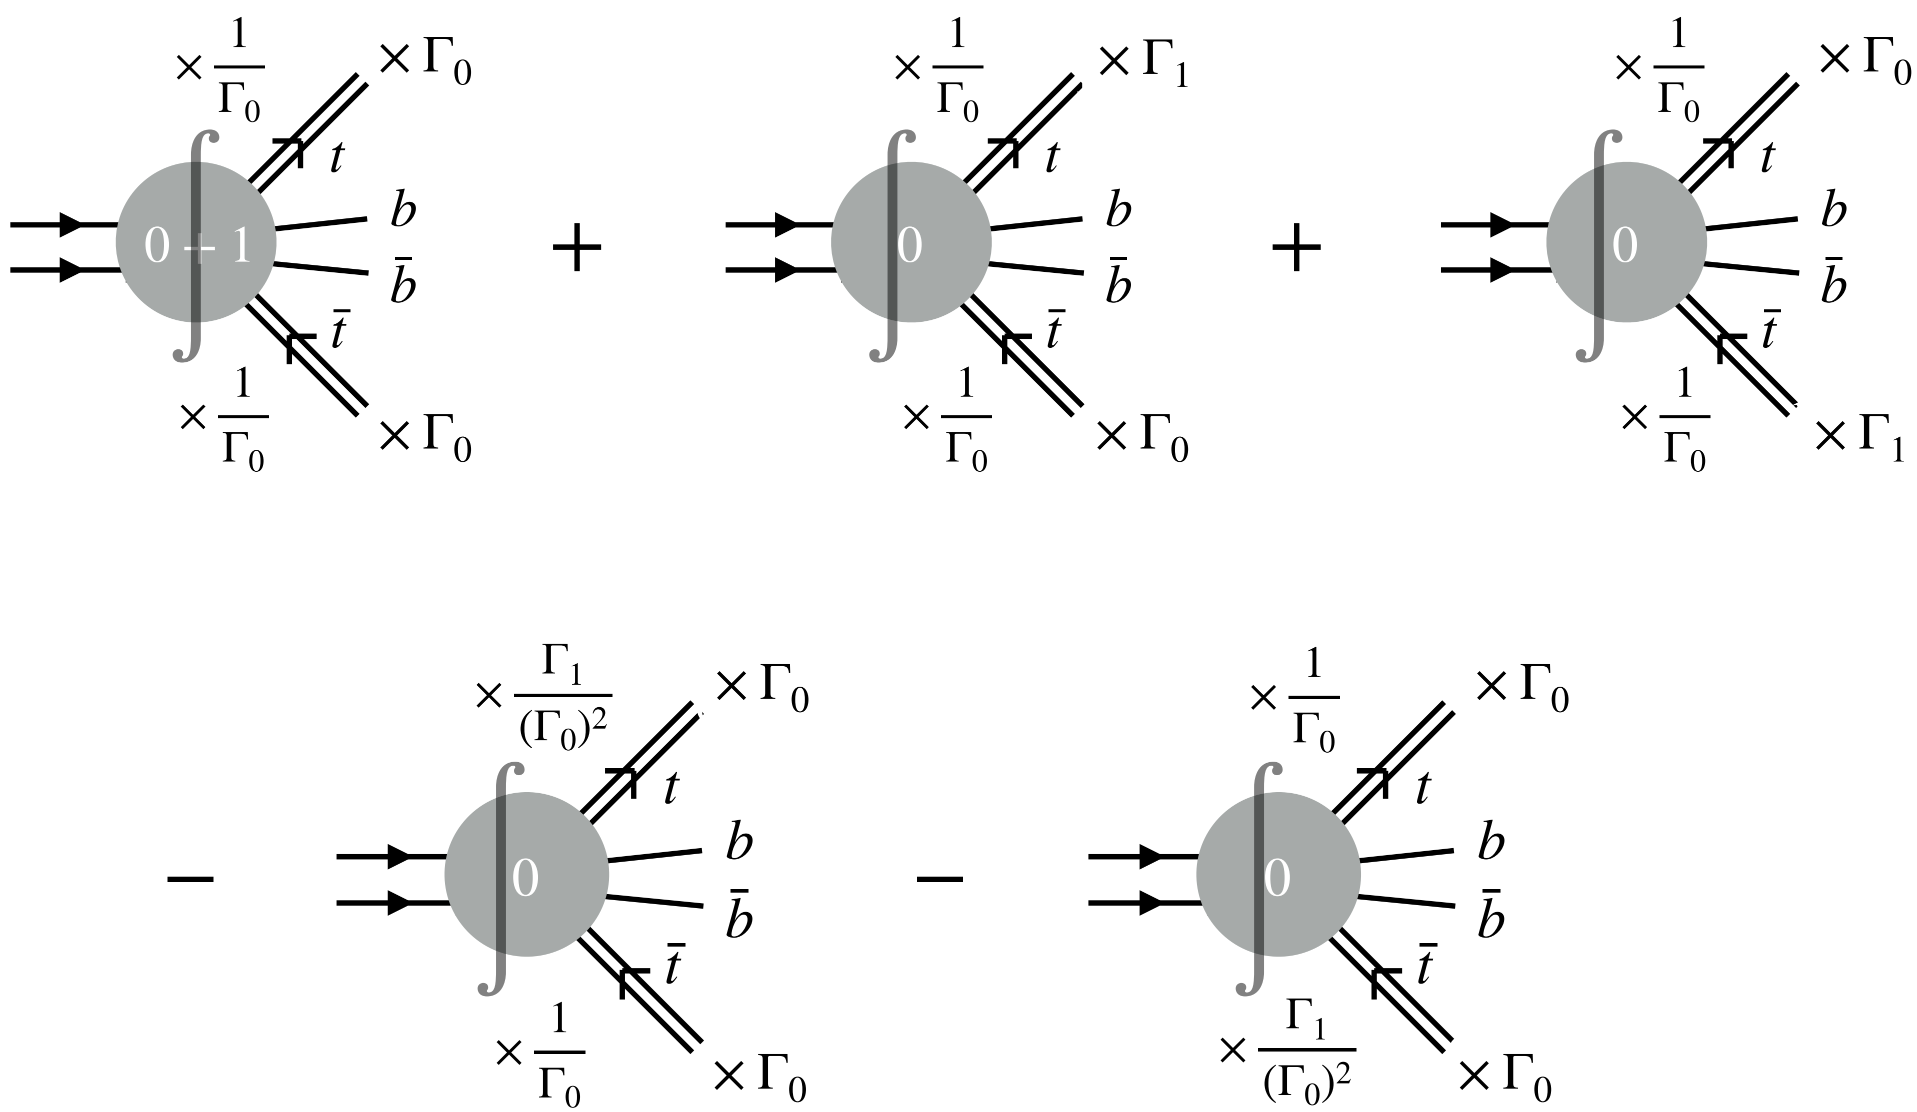
$$\int d\sigma^{NLO}_{\text{NWA}_{\text{Prod,exp}}} =$$



- "Expanded" cross section in NWA:

$$\frac{1}{\Gamma_0 + \Gamma_1} \sim \frac{1}{\Gamma_0} - \frac{\Gamma_1}{(\Gamma_0)^2} + \mathcal{O}(\alpha_s^2)$$

$$\int d\sigma^{NLO}_{\mathrm{NWA}_{\mathrm{Prod,exp}}} =$$

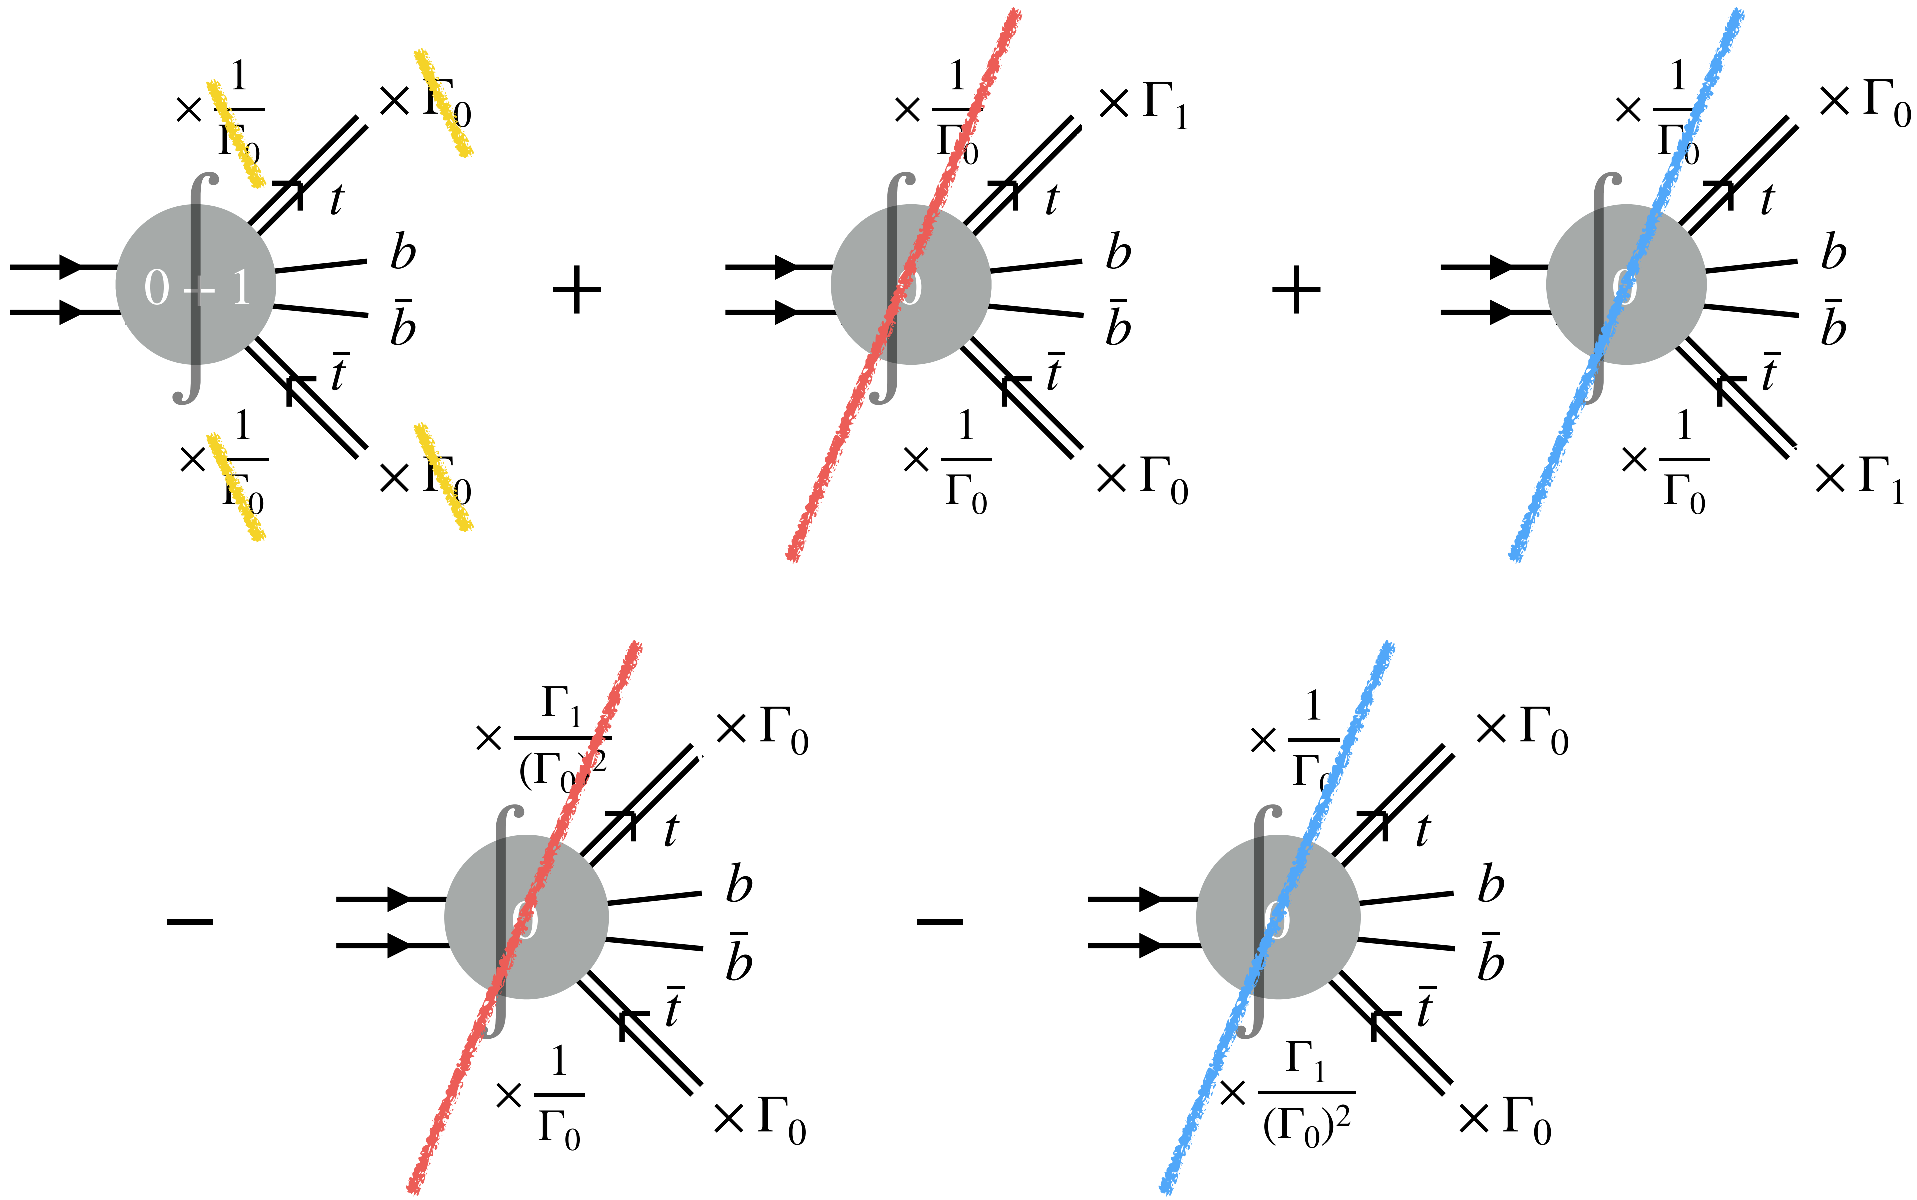


Effects of Γ_t expansion in NWA

- **"Expanded" cross section in NWA:**

$$\frac{1}{\Gamma_0 + \Gamma_1} \sim \frac{1}{\Gamma_0} - \frac{\Gamma_1}{(\Gamma_0)^2} + \mathcal{O}(\alpha_s^2)$$

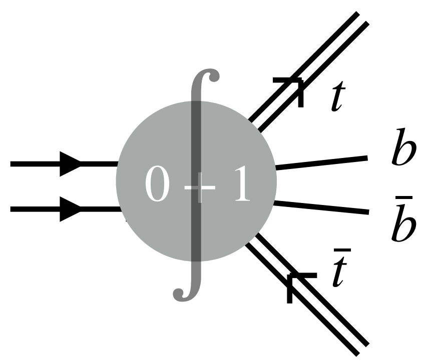
$$\int d\sigma^{NLO}_{\mathrm{NWA}_{\mathrm{Prod,exp}}} =$$



Effects of Γ_t expansion in NWA

- Rigorous expansion of Γ_t^{NLO} in NWA gets rid of "spurious" $\mathcal{O}(\alpha_s^2)$ contributions
- Note: the same procedure does not apply straightforwardly to the off-shell calculation

$$\int d\sigma^{NLO}_{\mathrm{NWA}_{\mathrm{Prod\,,exp}}} =$$



$$\equiv \quad \sigma^{\mathrm{NLO}}_{t\bar{t}b\bar{b},\ \mathrm{incl.}}$$

- The unusually large size of $\mathcal{O}(\alpha_s^2)$ effects, $\mathcal{O}(6\%)$, relates to the large size of QCD corrections to $t\bar{t}b\bar{b}$ production cross section

- These effects are well within the NLO scale uncertainties, $\mathcal{O}(20\%)$
