

Nuclear Structure Physics at the Darmstadt superconducting electron linear accelerator S-DALINAC *

N. Pietralla, K. Sonnabend for the SFB 634

Institut für Kernphysik, TU Darmstadt, Schlossgartenstr. 9, 64289 Darmstadt, Germany

The Institut für Kernphysik of Technische Universität Darmstadt operates the S-DALINAC, an in-house electron accelerator up to a maximum electron energy of 130 MeV in cw mode [1]. Electron beams and photon beams, produced by bremsstrahlung processes [2], are available to the experimentalists.

Electron scattering experiments can be performed at two different electron spectrometers, one having high energy resolution ($\Delta E < 30$ keV, LINTOTT [3]) and the other one having large acceptance for facilitating observation of exclusive coincidences in $(e,e'x)$ reactions (QCLAM [4]). Topics of electron scattering investigations include Coulomb-break up of light nuclei, spin-resolved level densities as well as collective and exotic nuclear excitation modes [5-8].

Photon scattering experiments address the nuclear dipole response. Two experimental sites are available: A high intensity continuous-energy bremsstrahlung beam with photon intensities up to 10^6 photons per $(\text{keV}\cdot\text{s}\cdot\text{cm}^2)$ and a tagged photon beam with an energy resolution of 25 keV at 10 MeV photon energy. Recent studies were concerned, *e.g.* with the Pygmy resonance of semi-magic nuclei [9] or the fine structure of the dipole response of doubly-closed shell nuclei [10,11].

* Supported by the DFG under grant No. SFB 634.
